# Rare Cancer definition

BioGrid
Connecting health information

- **Rare cancer: incidence < 6/100,000 population pa***
- **Collectively: 22% of all cancer diagnoses**
  **30% of all cancer deaths**
- **Often the precise cell of origin and etiology is unknown**
- **Treatment is according to closest histopathology/tumour stream**
- Lack of preclinical models and evidence-based treatment data
- Lack of appropriate clinical trials and/or drug approval and/or funding

(RARECARE: Surveillance of rare cancers in Europe; Gatta et al, Eur J Canc, 2011)

AUSTRALIAN RARE CANCER PORTAL

Outcomes are inferior to those for common cancers
(5-year survival of 47% compared to 65% for common cancers)

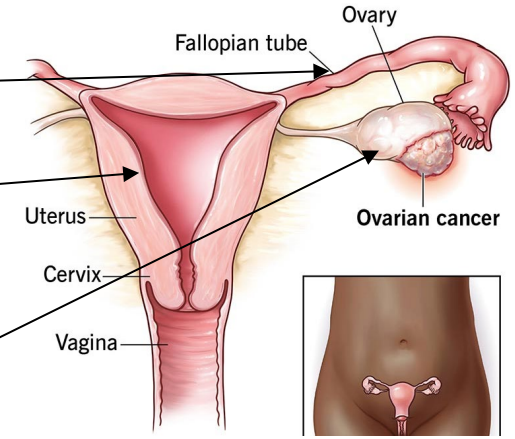
>50% of gynaecological cancers are classified as rare cancers

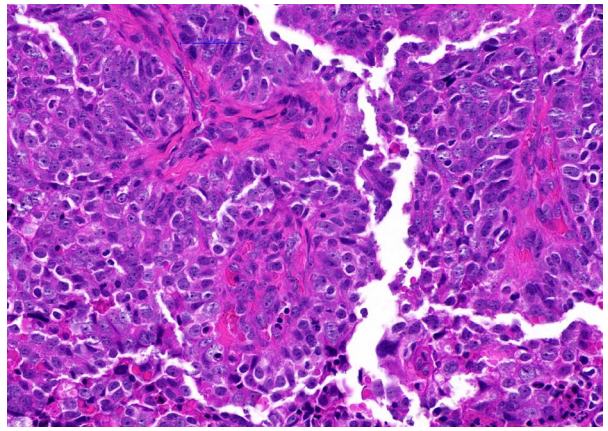
rare cancers AUSTRALIA

# Ovarian Cancer

- 2020, a total of 313,959 cases diagnosed globally
- 5-year overall survival ~49%
- Histological classifications

i. High-grade serous
ii. Low-grade serous
iii. Clear cell
iv. Endometrioid
v. Mucinous
vi. Sex cord-stromal tumours
vii. Carcinosarcoma
viii. Other very rare subtypes (i.e. malignant Brenner, sarcoma, germ cell tumours)



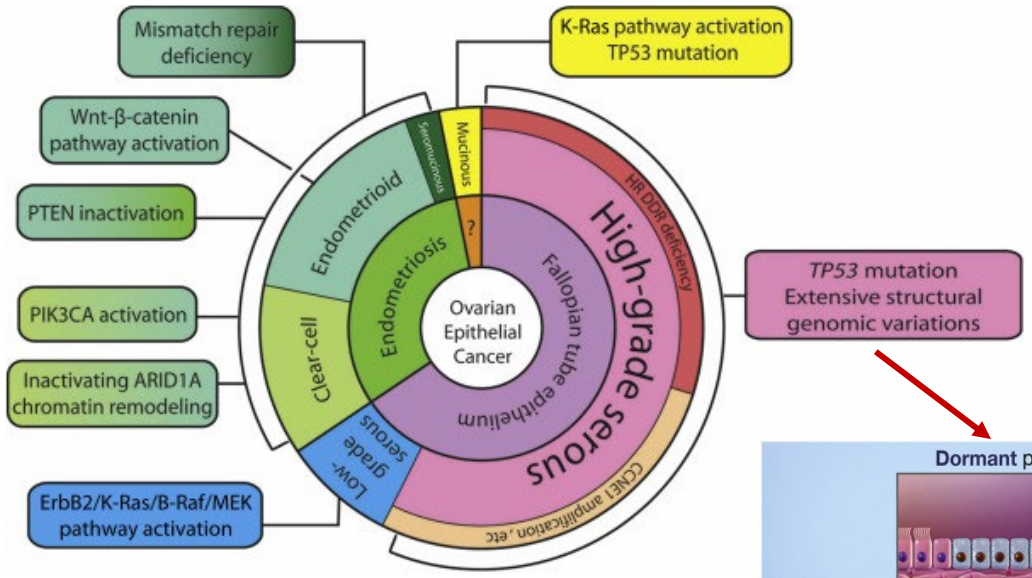


High grade serous ovarian carcinoma (#095)

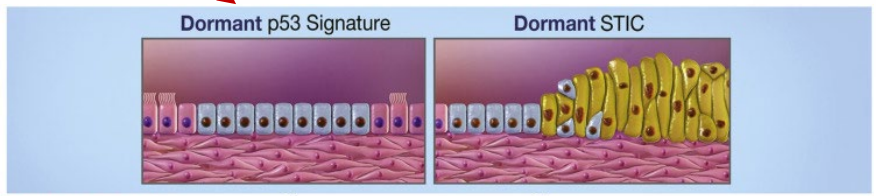
| Subtype | 5-year survival | *TP53*mut freq |
|---|---|---|
| High-grade serous | 32-84% | >95% |
| Low-grade serous | 54-93% | ~8% |
| Carcinosarcoma | 15-70% | >60% |
| Mucinous | 14-83% | ~64% |
| Endometrioid | 45-87% | ~30% |
| Clear cell | 22-82% | ~10% |
| Sex cord-stromal | 59-95% | ~5%* |

*mostly granulosa cell tumours (GCT), single case reports in Sertoli-Leydig and gynandroblastoma

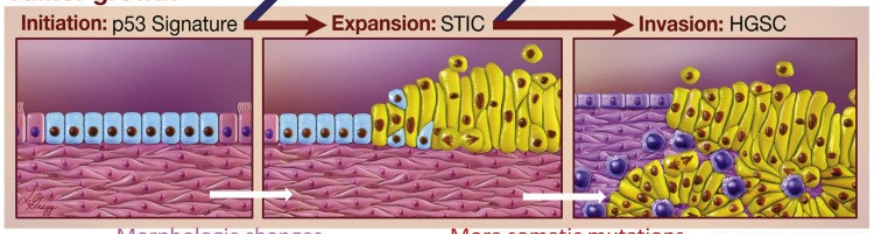
# Molecular characteristics of ovarian cancer subtypes and outcomes



*TP53* mutation
Extensive structural genomic variations



**Tumor growth**



Morphologic changes
More somatic mutations
Methylation change
LINE-1 activation
*CCNE1* amplification
Telomere shortening

More somatic mutations
More LOH events
Centrosome amplification
Telomere stops shortening
Immune cell infiltration

Genomic instability

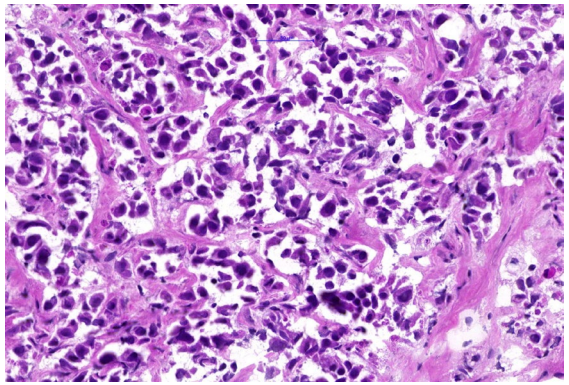
# Cervical/vulvar/vaginal Cancer

- **Worldwide**, cervical cancer is the 4th most commonly diagnosed cancer in women
- **Worldwide**, cervical cancer is responsible for the most gynae cancer-related deaths
- HPV incidence varies according to geographic location
- Incidence is reducing in some countries due to vaccination programs

5-year survival rates:

- Cervical cancer (~75% SCC): 55-66%
  - adenocarcinoma a challenge
- Vulvar cancer (mostly SCC): 41-90%
- Vaginal cancer (mostly SCC): 57-84%



Vulvar Paget's disease (#333)

| Subtype | 5-year survival | *TP53*mut freq |
|---|---|---|
| Squamous cell carcinoma (SCC) | 55-65% | 5-6% |
| Adenocarcinoma (incl. mucinous, clear cell and serous) | 55-65% | 4-18% |
| Other (i.e. adenosquamous, small/large cell neuroendocrine) | 34% (adeno), 27%(NET) | 6-13% |
| SCC HPV+ | 70-90% | 0-50% |
| **SCC HPV- (p53wt; p53mut)** | **49-76%; 41-55%** | **41-92%** |
| Melanoma | 15% | 18-22% |
| Other very rare subtypes include basal cell, verrucous, adenocarcinoma including **extra-mammary Paget's disease (20-38%),** Bartholin gland and sarcoma | | |
| Squamous cell carcinoma (HPV+) | 57-84% | ~29% (~17%) |
| Adenocarcinoma (inc. clear cell) | ND | ND |
| Melanoma | 15% | 28-33% |
| Other very rare subtypes include sarcoma and lymphoma | | |

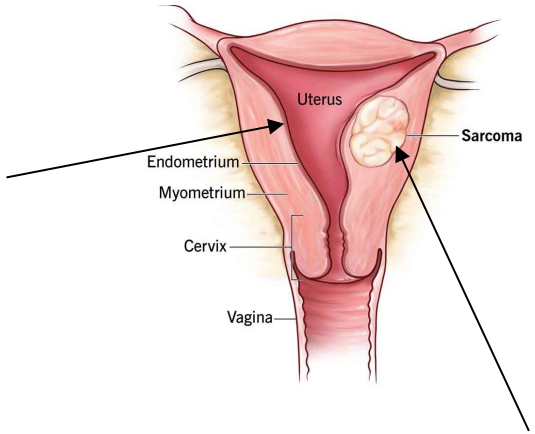
# Uterine Cancer

- 5th most common cancer in women
- 2019, 435,041 new diagnoses with **91,641 deaths globally**
- Rising incidence globally

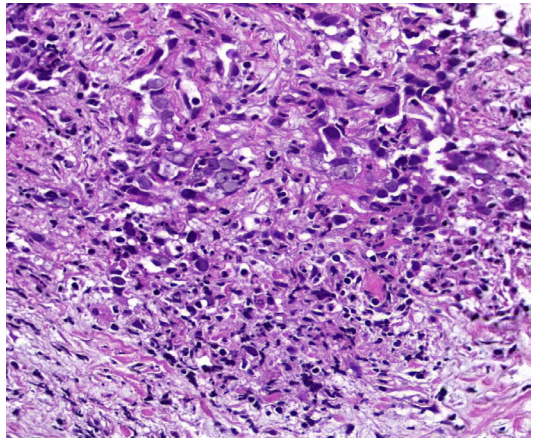
- 5-year overall survival ~83%
  Non-endometrioid have a worse prognosis

- 4 histological classifications for carcinomas (5-year survival)

i. Endometrioid (~85%)
ii. Clear cell
iii. Carcinosarcoma
iv. Serous



- Uterine sarcomas account for 3-7% of uterine malignancies



High grade serous endometrial carcinoma (#116)

| Subtype | 5-year survival |
|---|---|
| Endometrioid | ~86% |
| Uterine serous cancer | 0-50% |
| Clear cell | 46-62% |
| Carcinosarcoma | 15-70% |
| uLMS | 14-63% |
| Adenosarcoma | 23-70% |
| Low-grade stromal sarcoma | 80-90% |
| High-grade stromal sarcoma | 15-40% |
| PEComa | ND |

# Molecular landscape of uterine cancer and survival outcomes

RAINBO Research Consortium, Int J Gynecol Cancer. doi:10.1136/ijgc-2022-004039

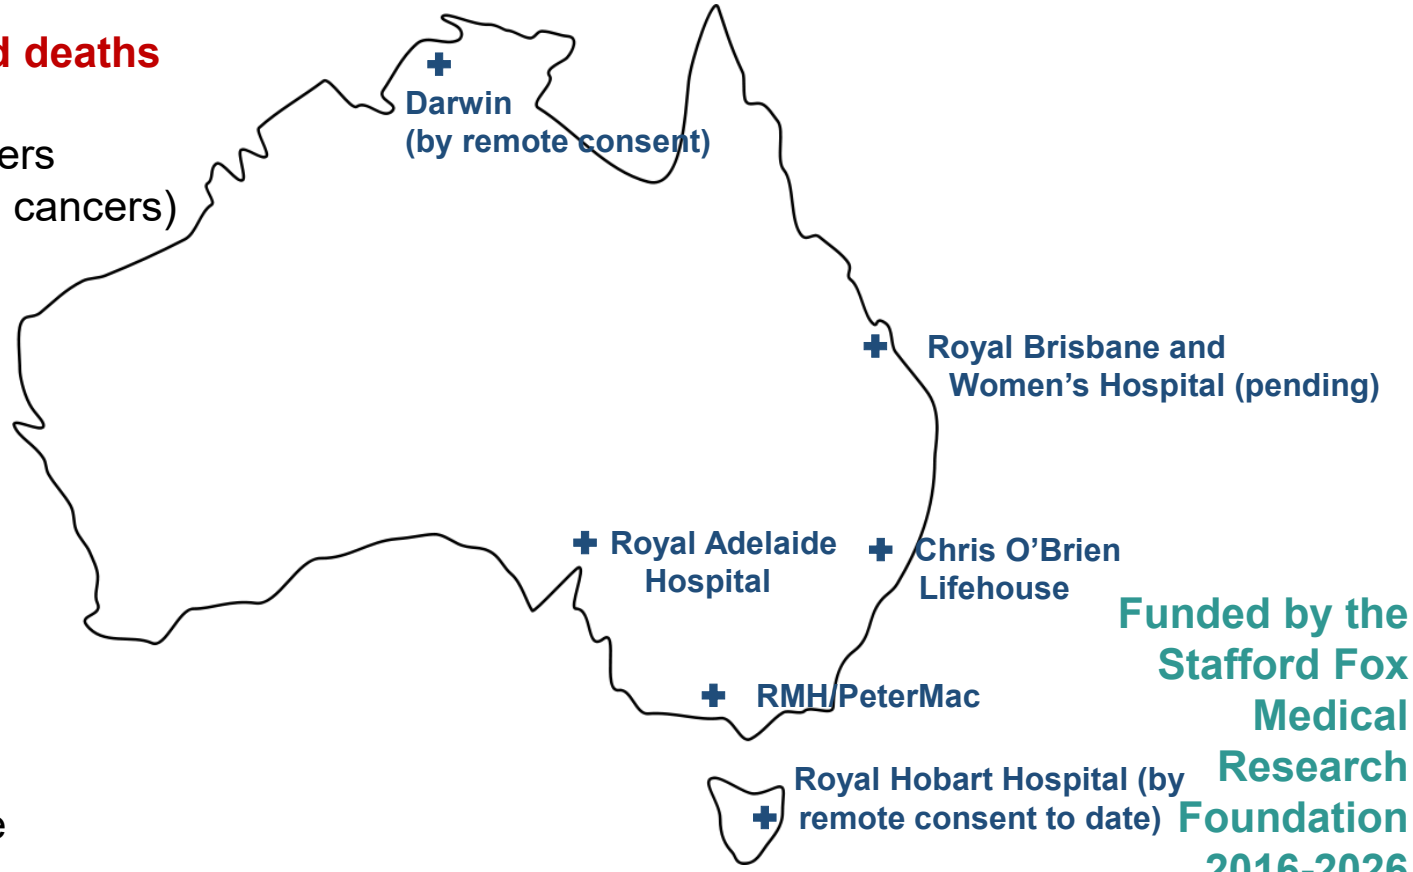
# WEHI Stafford Fox Rare Cancer Program:
## National – PIs Clare Scott and Tony Papenfuss

- National study of rare cancer cases (patients to be able to provide consent in each capital city)
- Patients can consent via **remote option OR via the ARC Portal**
- Collection of clinical data and tissue (eg FFPE, fresh tissue from surgery or biopsy, blood incl cfDNA, PBMCs, plasma)

**AIM: To build a national rare cancer resource to underpin rare cancer research**

Rare cancers account for **~30% of all cancer-related deaths**

**Inferior** outcomes for individuals with rare cancers
(5-year survival of **47%** compared to 65% for common cancers)



**We offered sequencing for RC patients nationally**
WGS if fresh tissue of sufficient purity
WES if FFPE / and sufficient purity
TSO500 if low tumor purity/germline DNA unavailable

Funded by the Stafford Fox Medical Research Foundation 2016-2026

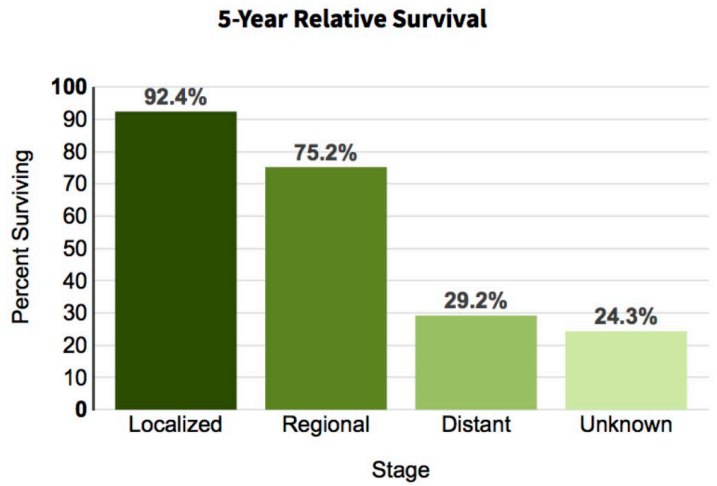
# Pre-clinical models to aid delivery of PARPi in HGSOC

# High-grade serous ovarian carcinoma (HGSOC)

- Most common epithelial ovarian cancer subtype (~75% cases)
- Aggressive, often diagnosed at advanced stage
- Poor survival outcomes



## Molecular characteristics:

- Ubiquitous ***TP53*** mutations
- Homologous recombination (HR) DNA repair pathway defects
  - *e.g* ***BRCA1*** **and** ***RAD51C***
- High degree of genomic instability

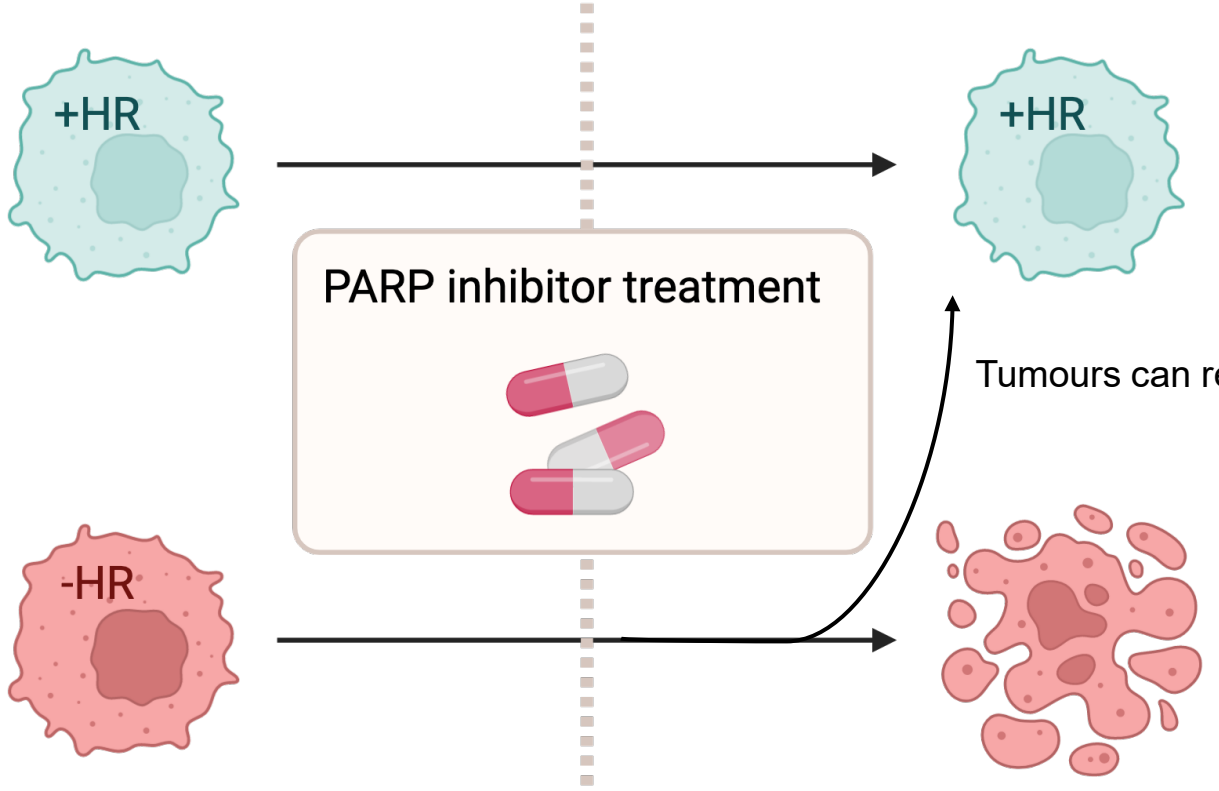
Susceptible to treatment with:

- **Platinum agents**
- **PARP inhibitors**

SEER 2009-2018 data; Bowtell et al., Nat Rev Cancer, 2015

# PARP inhibitors (PARPi)

- Despite their great success in the clinic, **many patients on PARPi eventually relapse**
- Multiple PARPi resistance mechanisms have been described, many rely on restored HR DNA repair
    - *e.g.* secondary HR gene mutations, loss of HR gene methylation, alternative splicing



Tumours can restore HR under treatment pressure
➔ PARPi resistance

Commonly used PARPi:
Rucaparib, Olaparib and Niraparib

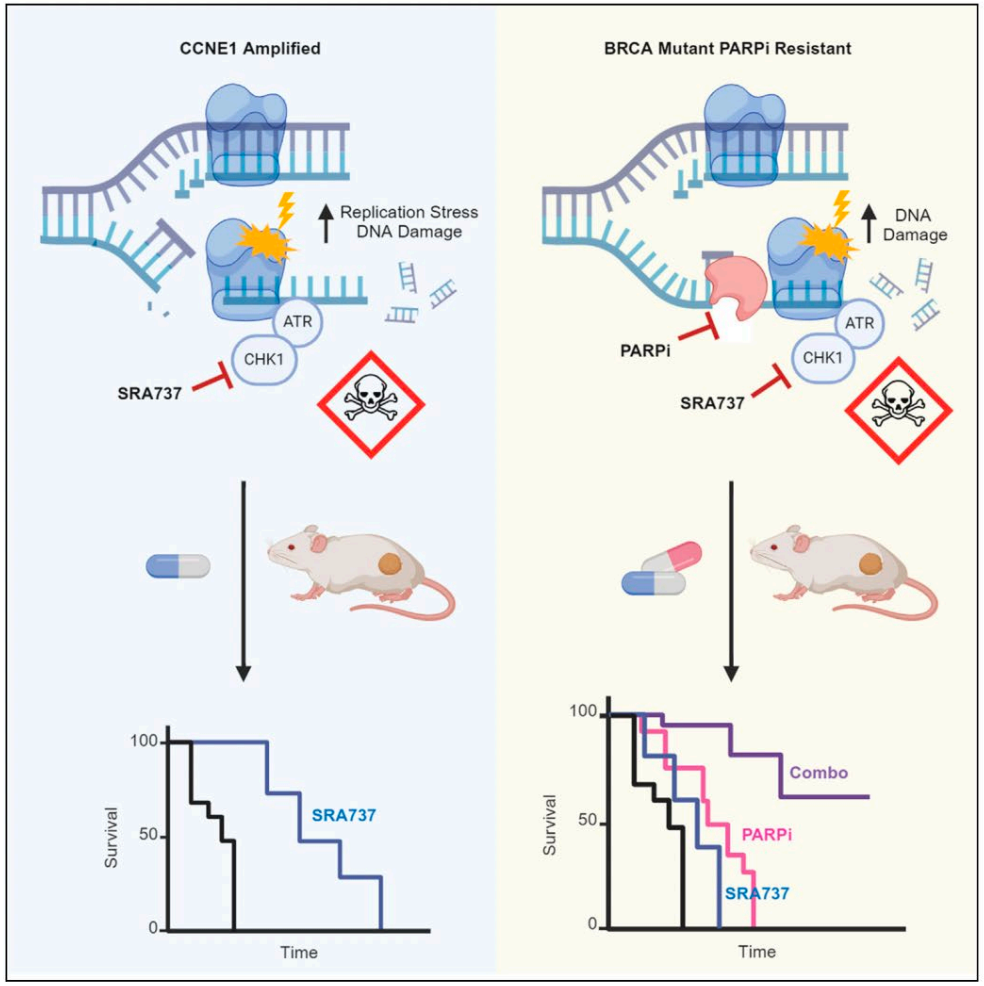
## CHK1 inhibitor SRA737 is active in PARP inhibitor resistant and *CCNE1* amplified ovarian cancer



Haineng Xu, Sarah B. Gitto, Gwo-Yaw Ho, ..., Cassandra J. Vandenberg, Clare L. Scott, Fiona Simpkins

scottc@wehi.edu.au (C.L.S.)
fiona.simpkins@pennmedicine.edu (F.S.)

### Highlights

Selective oral CHK1 inhibitor SRA737 alone is active in CCNE1 amplified models

SRA737 combined with PARP inhibitor shows synergy in multi-drug resistant cells

Combination treatment increases replication stress and apoptosis

Combination shows significant activity in PARPi-resistant BRCA mutant PDX models

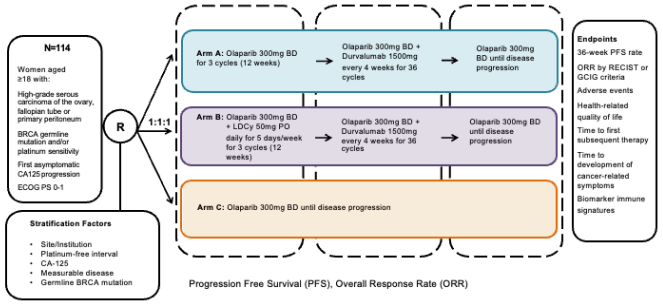
## Background:

- Priming of immune cells in epithelial ovarian cancer (EOC) could improve response to immune checkpoint inhibitor.
- We hypothesized priming with olaparib or olaparib with LDCy will enhance the effect of the subsequent combination olaparib and durvalumab.
- We hypothesized an immune signature in blood could have prognostic utility.

## Methods:

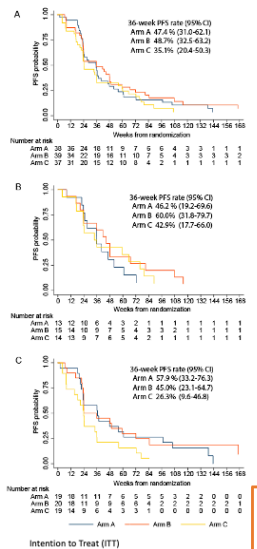
- We conducted a multi-centre, non-comparative, phase 2 randomized controlled trial



Progression Free Survival (PFS), Overall Response Rate (ORR)

## Progression-free survival by randomized arms:

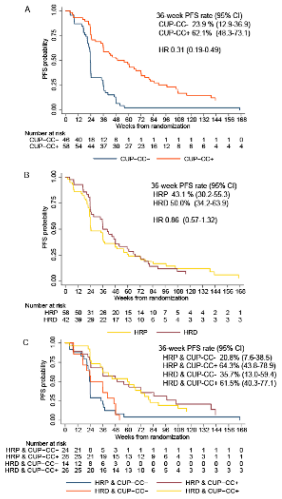
(A) ITT population (B) HRD population (C) HRP population



Intention to Treat (ITT)
Homologous Recombination Defective (HRD)
Homologous Recombination Proficient (HRP)

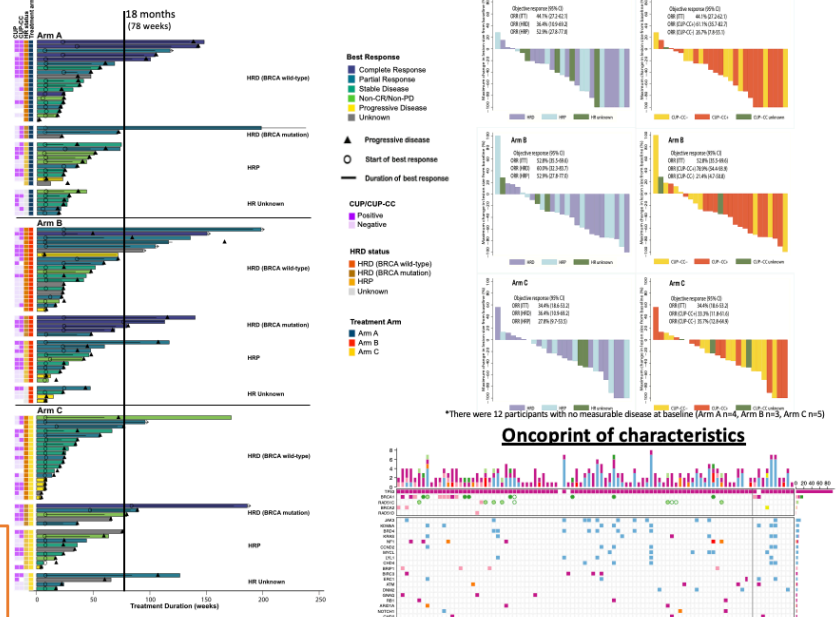
## Progression-free survival by:

(A) CUP-CC status (B) HR-status
(C) Combination HR and CUP-CC status



**Immune signature: CUP-CC**
**CUP: CCR4 upregulation (CUP)** proportion of effector CD4 and CD8 T cells post *in vitro* MAF treatment.
**CC: levels of four cytokines/chemokines (CC)**: We explored combining these cytokines and chemokines (CC) to further enhance the prognostic utility of CUP, generating a CUP-CC signature.
**HR status:** HRD or HRP (details in oncoprint).
**Combined immune and HR status:** CUP-CC status and PFS separated by HRP/HRD.

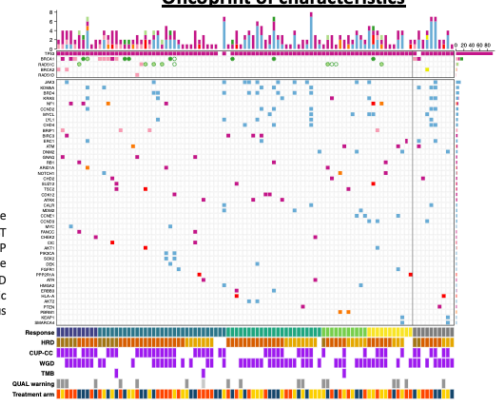
## Swimmer plot: outcome by treatment arms according to HR status



## Objective response rate by randomized arms according to HR or immune status*

*There were 12 participants with no measurable disease at baseline (Arm A n=4, Arm B n=3, Arm C n=5)

## Oncoprint of characteristics



## Baseline characteristics

| | Arm A N=38 (%) | Arm B N=39 (%) | Arm C N=37 (%) |
|---|---|---|---|

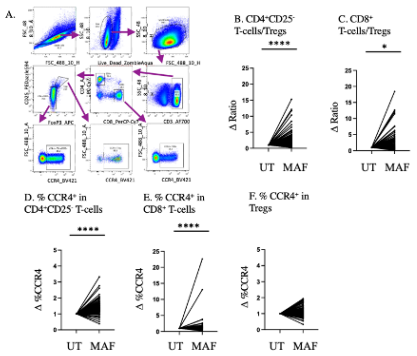
| ECOG PS 0 | 31 (81.6) | 32 (82.1) | 27 (73.0) |
| Measurable disease | 27 (71.1) | 28 (71.8) | 26 (70.3) |
| PFI >12 months | 25 (65.8) | 24 (61.5) | 24 (64.9) |
| CA125>100 | 23 (60.5) | 24 (61.5) | 22 (59.5) |
| HRP BRCA wild-type | 19 (50.0) | 20 (51.3) | 19 (51.4) |
| HRD BRCA mutation | 3 (7.9) | 5 (12.8) | 5 (13.5) |
| HRD BRCA wild-type | 10 (26.3) | 10 (25.6) | 9 (24.3) |
| CUP-CC- | 15 (42.9) | 16 (44.4) | 15 (45.4) |
| CUP-CC+ | 20 (57.1) | 20 (55.6) | 18 (54.6) |

## Development of the CUP assay



**CCR4-upregulation (CUP) ASSAY.**
**Mafosfamide (bioactive cyclophosphamide derivative) increases *in vitro* the CD4$^+$CD25$^-$ T cells/Treg and CD8$^+$ T cells/Treg ratio, and the expression of CCR4 on the surface of CD4$^+$CD25$^-$ T cells and CD8$^+$ T cells, but not Treg in SOLACE2 participants at baseline.** T-cell subsets and percentages of CCR4$^+$ expressing cells were measured following 72 hrs incubation of peripheral blood mononuclear cells (PBMC) with or without Mafosfamide (MAF), using flow cytometry (N=106). A) Gating strategy. B) Ratio of CD4$^+$CD25$^-$ T cells/Treg and C) CD8$^+$ T cells/Treg increased following MAF culture. Mafosfamide increased the proportion of CCR4+ cells within D) CD4$^+$CD25$^-$ T cells, E) CD8$^+$ T cells, but not F) Treg. Untreated (UT). Non-parametric Wilcoxon matched-pairs signed-rank test. **** P<0.0001, *** P<0.001, ** P<0.01 * P<0.05.

## Conclusion

- Priming with either olaparib alone or olaparib with LDCy, followed by olaparib+durvalumab resulted in numerically greater 36-week PFS rates than did olaparib continuous monotherapy
  - however, this trial failed to meet the prespecified threshold.
- CUP-CC+ immune signature was prognostic for greater PFS for olaparib-based treatments.
- By contrast, increased T effector/Treg ratios were not prognostic of PFS (data not shown).
- CUP-CC has prognostic utility across both HRD and HRP EOC.
- Future studies need to investigate the utility of CUP-CC as a biomarker to supplement or replace tissue-based HRD testing for EOC.

**Oncoprint:** Whole Exome Sequencing analysis (TWIST Exome 2.0 with 1Mb SNP backbone and IDT UMI for single molecule normalization); HRD status determined by Genomic Instability Score, mutation status and manual review.

**Promoter methylation analysis of *BRCA1* and *RAD51C***

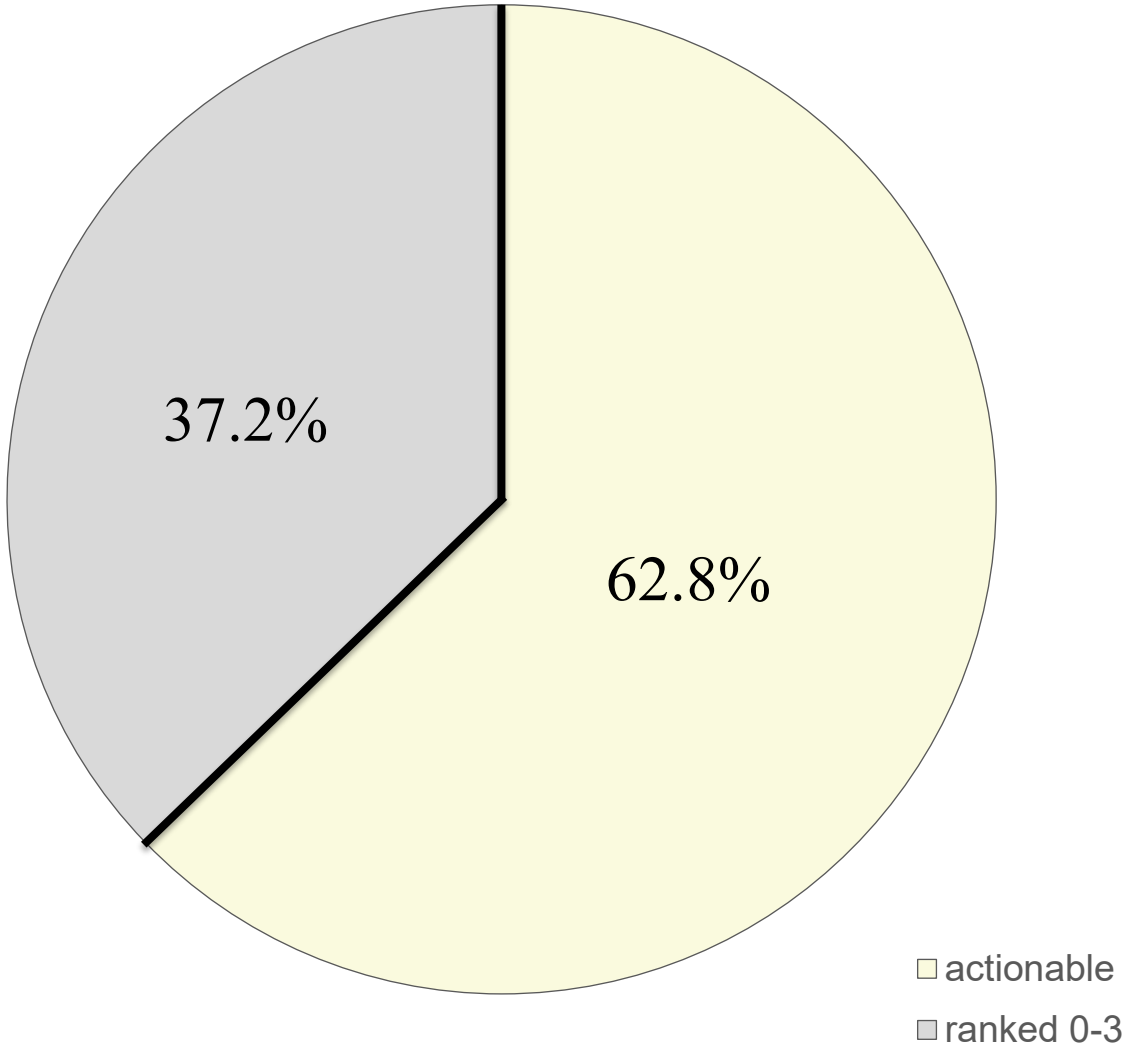
# WGS in all cases - actionable aberrations identified



**Ranking**

10 - change in diagnosis to PBS therapy with CR
9 - change in diagnosis to PBS therapy with prolonged SD, PR or CR

8 - accessed therapy - CR (includes treatment on PBS)
7 - accessed therapy - PR or prolonged SD >6mo

6 - accessed therapy - potential benefit (includes trials)
5 - clinical trial available in Australia

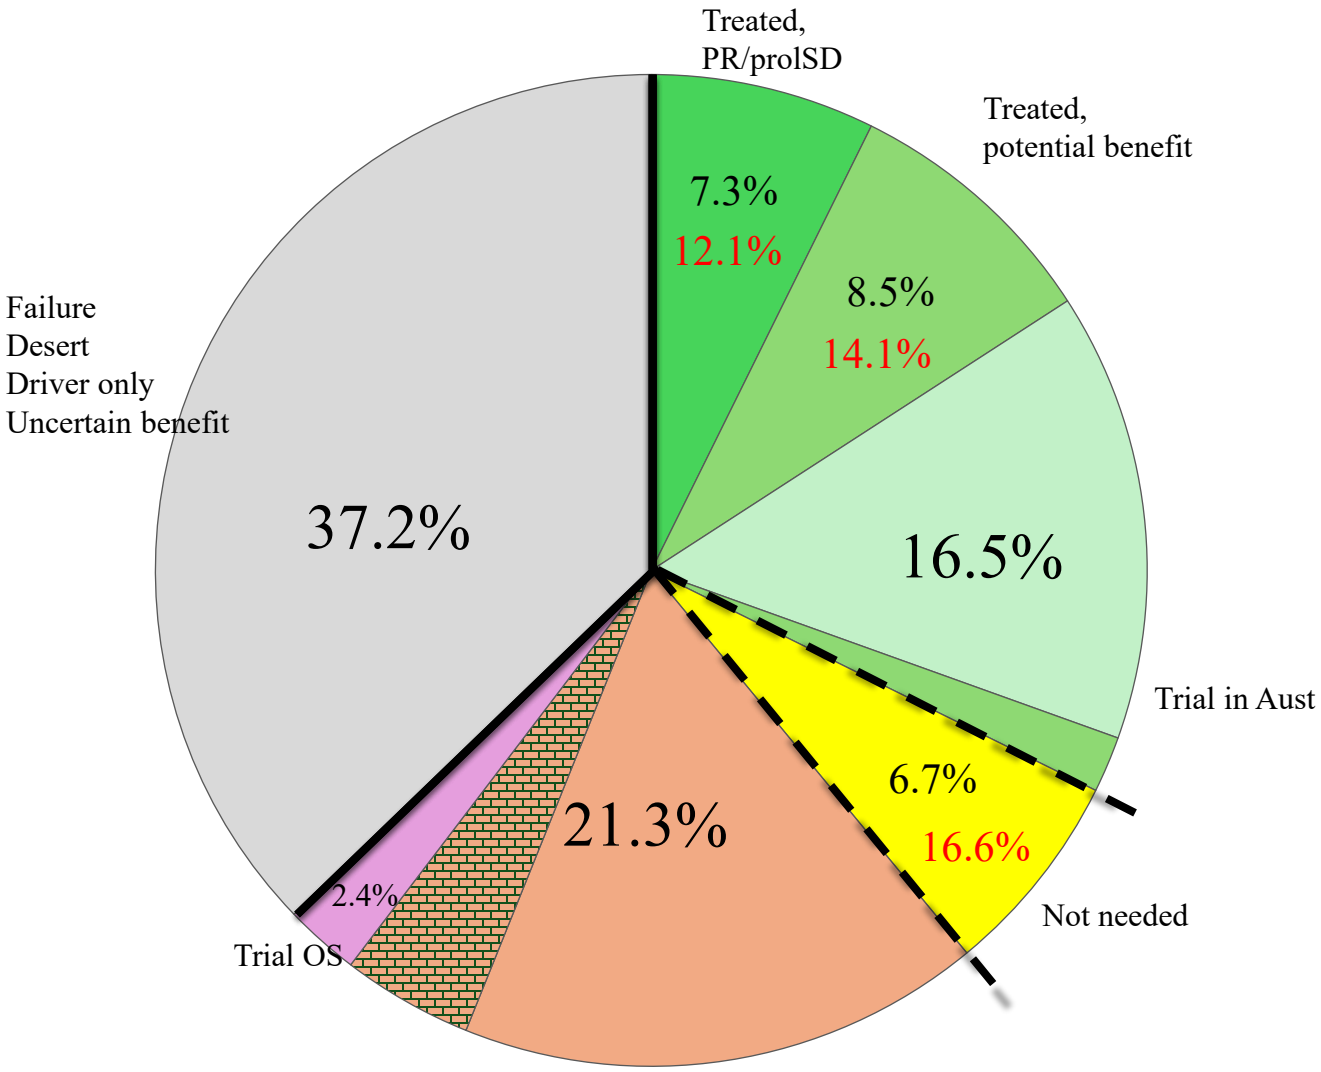
4 - clinical trial available outside Australia

3 - matched treatment questionable eg PIK3CAi

2 - nothing actionable, has a known driver
1 - nothing actionable, no driver = desert
0 - nothing actionable due to technical/sample failure

Dr Ratana Lim, SFRCP Team

# WGS in all cases – treatment access and eligibility



ranked 7
ranked 6
ranked 5
5 - accessed
5 - not needed
5 - too late
PDX (4-5)
ranked 4
ranked 0-3

8 - access to therapy with CR (PBS funded therapy or not)

7 - access to therapy with PR, or prolonged stable disease >6 months

6 - accessed therapy with potential benefit, including clinical trials

5 - potentially eligible for clinical trial in Aust

% of all 164 samples

% of actionable findings

- Samples tested too late in the patient's journey
- Could not access/ drug not available in Aust
- Single agent therapies not enough?

Patient data still ongoing

Dr Ratana Lim, SFRCP Team

# HER2 amplified rare gynaecological cancers

# HER2 amplifications occur throughout gynae tract, predominantly in rare adenocarcinoma subtypes

| Tumor Type | HER2 amplification rate per tumour histologic subtype | | | |
|---|---|---|---|---|
| Ovarian | 0/53 HGSOC | 1/11 HGFTC (panel) | 0/6 PPC | 0/41 other OC |
| Endometrial | 18/54 USC* | 1/1 HG EEC | | |
| Cervical | 0/11 SCC | 1/20 adenoca incl 1/7 GAS# | | 0/6 clear cell, 1 other CC |
| Vulval | 0/5 SCC | 1/1 Paget's-derived adenoca | | |
| Vaginal | 0/1 vaginal | 1/1 Vaginal adenoca | 2/2 mucinous adenoca | 0/1 SCC vag/periurethral |

**25 cases HER2-amp rare gynae cancer:**
**WGS, WES, panel, IHC**

**Encourage HER2 IHC/ISH of all rare gynae adenocarcinoma histologies**

* Reflects referrals to HGSEC HER2 project (VCA Fellowship) – agrees with current estimate of 30% HGSEC being HER2+

# GAS endocervical adenocarcinoma - Mucinous adenocarcinoma of gastric type of the uterine cervix
- patient benefited from T-DM1 (trastuzumab emtansine) on MoST trial
- 7-14% HER2+ previously seen in other GAS studies, with one study also identifying activating mutations in 7% cases

- Additional cases with equivocal HER2 staining (2+) – T-DXd (trastuzumab deruxtecan) effective in low-HER2 cases

**HER2 therapies should be considered for more rare-gynae subtypes (not just UCS)**

Ratana Lim, Gayanie Ratnayake, SFRCP Team and Grimmond Lab

Orla McNally, David Bernshaw, Marisa Grossi, Gayanie Ratnayake, Cass Vandenberg, Grimmond Team, SFRC Team

# How best to match targets identified in a rare cancer

# How often will one matched therapeutic reveal true potential?

- **What is the aim of molecular sequencing – especially in rare cancers?**

- To identify potential therapeutic targets eg the top one, two or three targets in a tumour
- Most new therapies are evaluated as single agents - very few agents are impressive
- Rational targeting of two aberrations +/- a third treatment: a triple combination
- What should the third drug be?

  Chemotherapy? Immunotherapy? RT? ADC? A third targeted therapy?

- The majority of rare cancers are treated with single agent therapy following molecular sequencing,
- as combination therapy is more expensive, difficult to access, unproven (ComboMATCH underway)
- **Results may be misleading**

# How often will one matched therapeutic reveal potential in a generic combination?

- We need to trial combination therapies

British Journal of Cancer

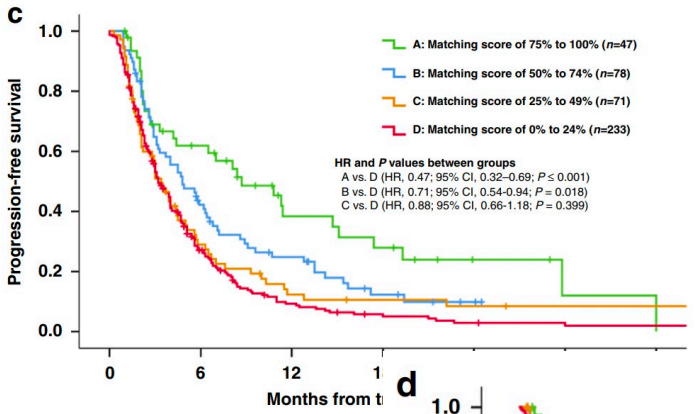
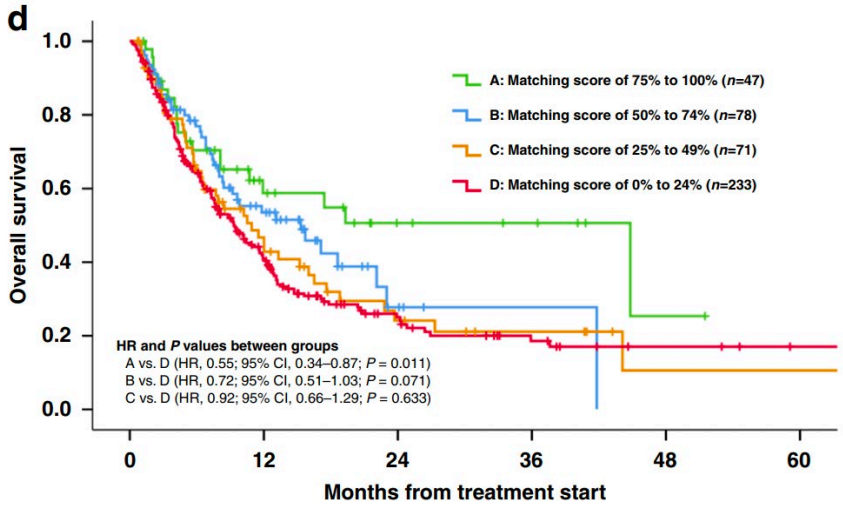
## Real-world data from a molecular tumor board demonstrates improved outcomes with a precision N-of-One strategy

Shumei Kato et al.#





# Using preclinical models to study therapeutic efficacy and resistance in rare uterine malignancies

# Uterine Cancer

- 5th most common cancer in women

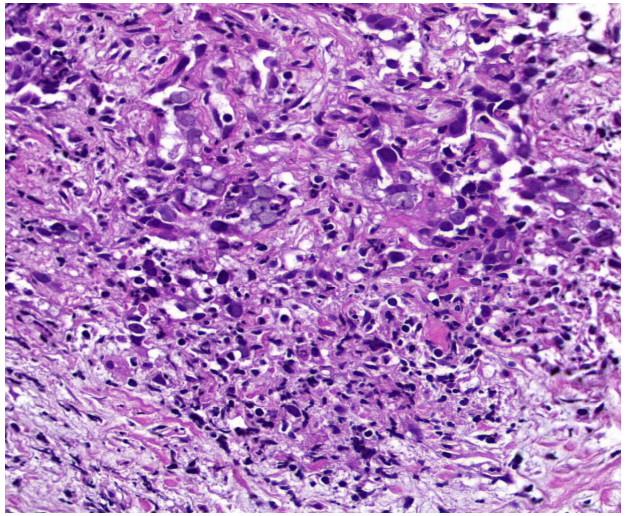
- Rising incidence globally

- 5-year overall survival ranges ~83% (common subtypes have good prognosis)

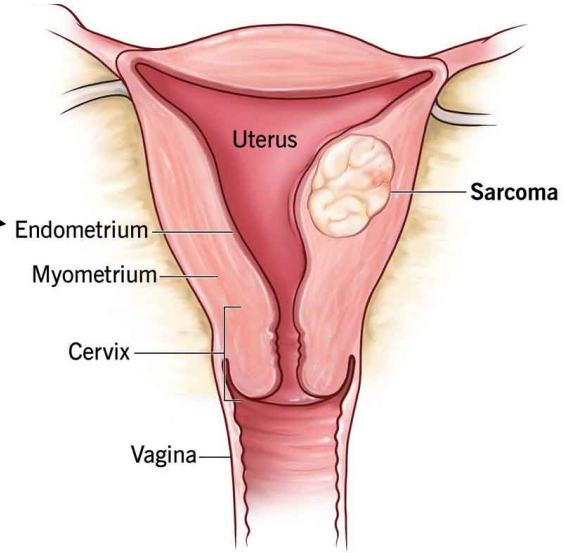
- 4 histological classifications for carcinomas (5-year survival)

  i. Endometrioid (common; 86%)
  ii. Clear cell (rare; 46-62%)
  **iii. Carcinosarcoma (rare; 30-40%)**
  **iv. Serous (rare; 0-50%)**

- **Uterine sarcomas account for 3-7% of uterine cancers**



High grade serous endometrial carcinoma



# Rare and aggressive subtypes of uterine cancer

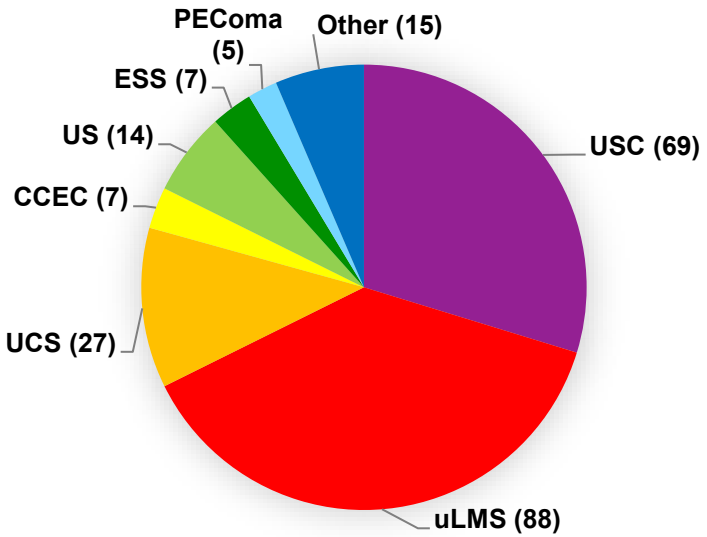
**Standard treatments:**

- Platinum- and taxane-based chemotherapy (carcinoma and mixed subtypes)
- Gemcitabine and doxorubicin chemotherapy (sarcoma)

**Rare subtypes have a much worse prognosis:**

- Initial treatment failure, or
- Recurrence with chemoresistance due to:
    - DNA repair mechanisms increased
    - Drug efflux pumps increased
    - Survival pathways increased
    - Suppression of immune responses

**Stafford Fox Rare Cancer Program**



**Subtypes (5-year survival)**
uLMS = uterine leiomyosarcoma (~30-42%)
USC = uterine serous carcinoma (0-50%)
UCS = uterine carcinosarcoma (30-40%)
US = uterine sarcoma (~43%)
ESS = endometrial stromal sarcoma (~10%)
CCEC = clear cell endometrial cancer (42-62%)

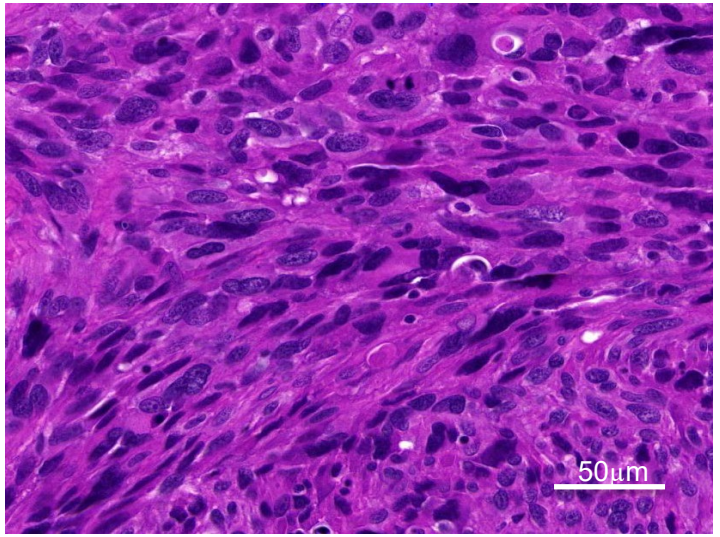
Dr Holly Barker

# Uterine Leiomyosarcoma (uLMS)

Dr Gen Dall

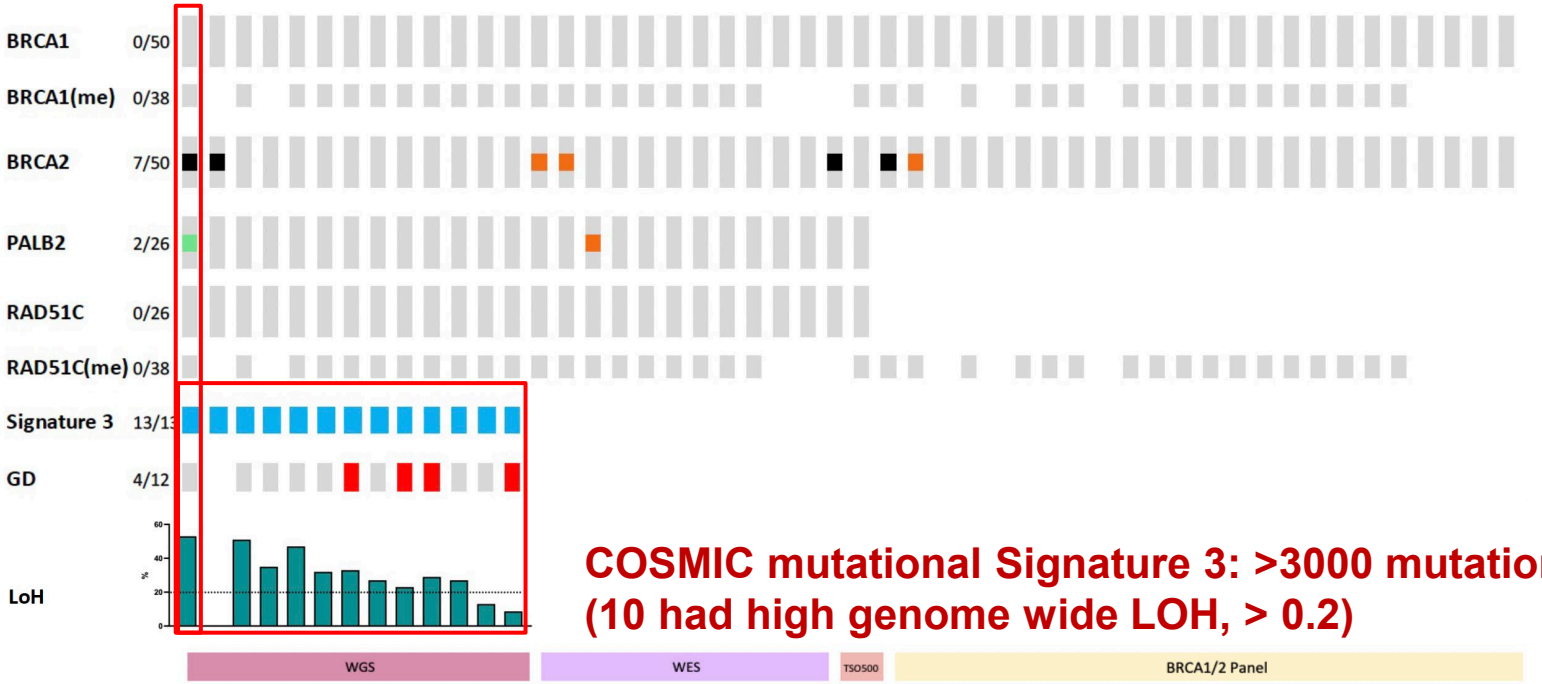
- Smooth muscle tumour arising from the muscular wall of the uterus
- Incidence rate ~0.8/100,000 women (1-2% of all uterine malignancies)
- 5-year survival:
  - up to 75% for early stage disease
  - 10-15% for metastatic uLMS

#1227



# Measuring HR abnormalities in uLMS

SFRCP recruited 88 patients (incl. remote consent via ARC portal)
HR screened (**67 to date**): WGS (fresh tissue; n=22)
WES (low tumour purity fresh tissue or high tumour purity FFPE; n=25)
Panel tests (FFPE) (TSO500 or HR BROCA panel (EM Swisher) or BRCA1/2 only; n=55)



Stafford Fox Medical Research Foundation

Overall:
**4/50 (8%) pathogenic aberrations**

8/50 (16%) any variants

**13/13 (WGS) COSMIC mutational Signature 3**

**COSMIC mutational Signature 3: >3000 mutations, in top 3 signatures (10 had high genome wide LOH, > 0.2)**

| Test | BRCA1/2 | Other HR genes | COSMIC Signature 3 | LoH signature |
|---|---|---|---|---|
| WGS | ✅ | ✅ | ✅✅ | ✅✅ |
| WES | ✅ | ✅ | ✅ | ✅ |
| TSO500 | ✅ | ✅ | X | X |
| BRCA1/2 panel | ✅ | X | X | X |

WGS = Whole genome sequencing
WES = Whole exome sequencing
LoH = Loss of Heterozygosity

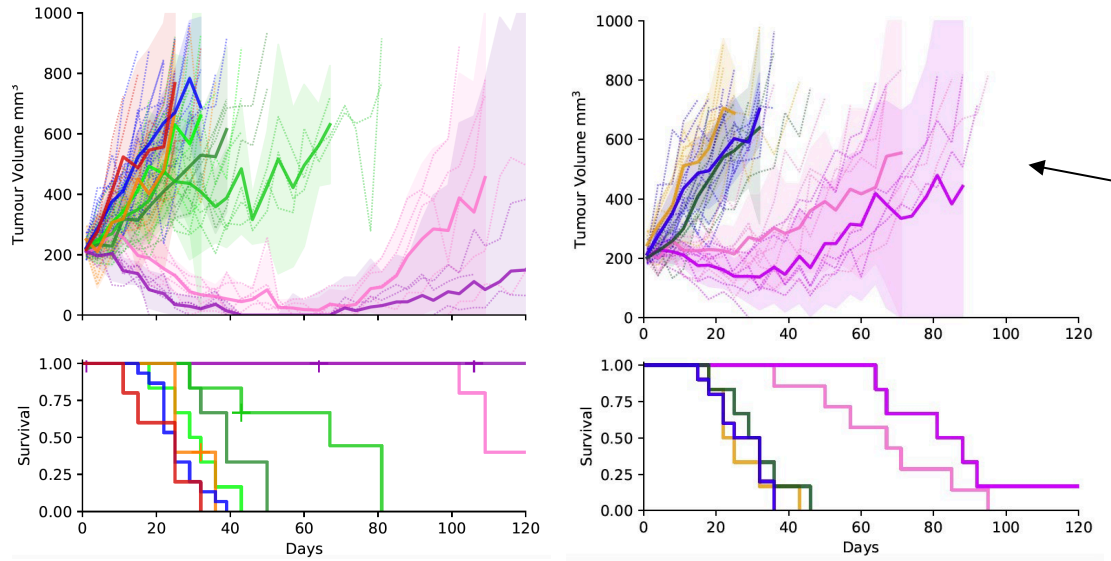
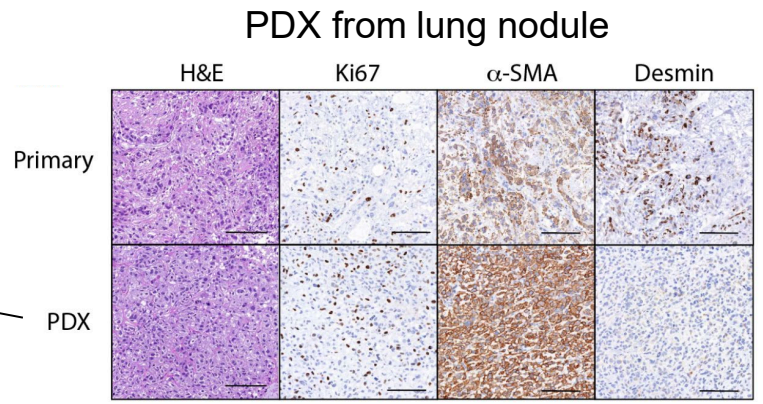
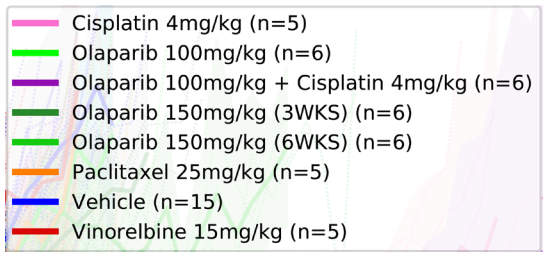
**Radiotherapy (SABR) to 2 sites then continued Olaparib**

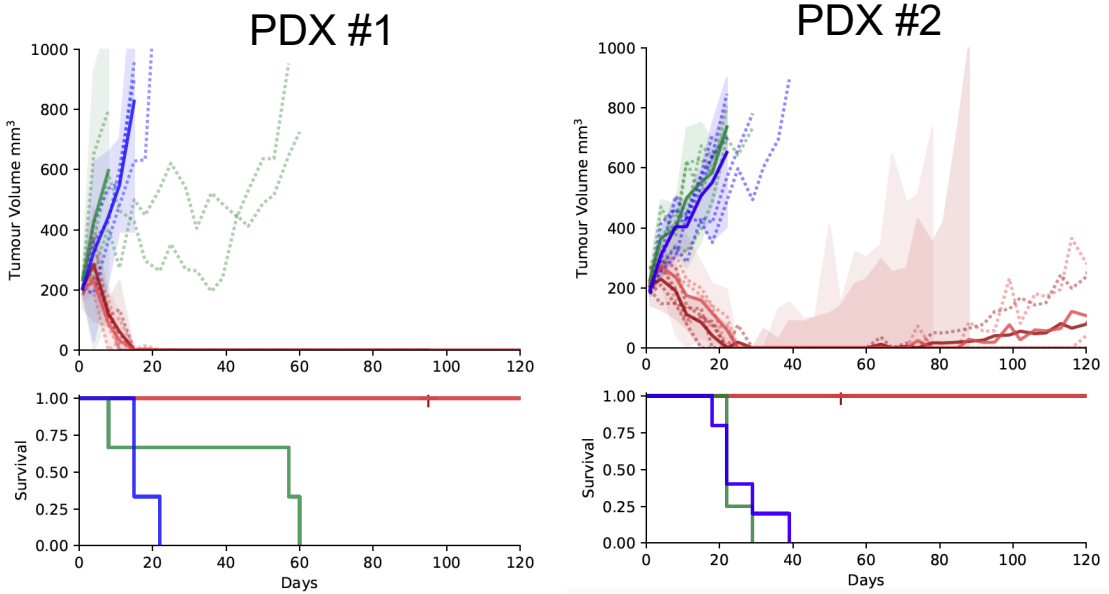
Cassandra Vandenberg, Kathy Barber, Silvia Stoev, Sean Grimmond, Joep Vissers, Layla Zhu, Wing-Yee Lo, Oliver Hofmann, Jocelyn Penington, Justin Bedo, Tony Papenfuss, Gayanie Ratnayake, Teng Tan, Ian Collins, Steve Barnett, Matt Wakefield

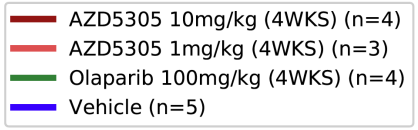
# uLMS #122 PDX #2 PRKDC variants resistant to olaparib but responsive to selective PARP1i AZD5305 (Pt Rx with RT)





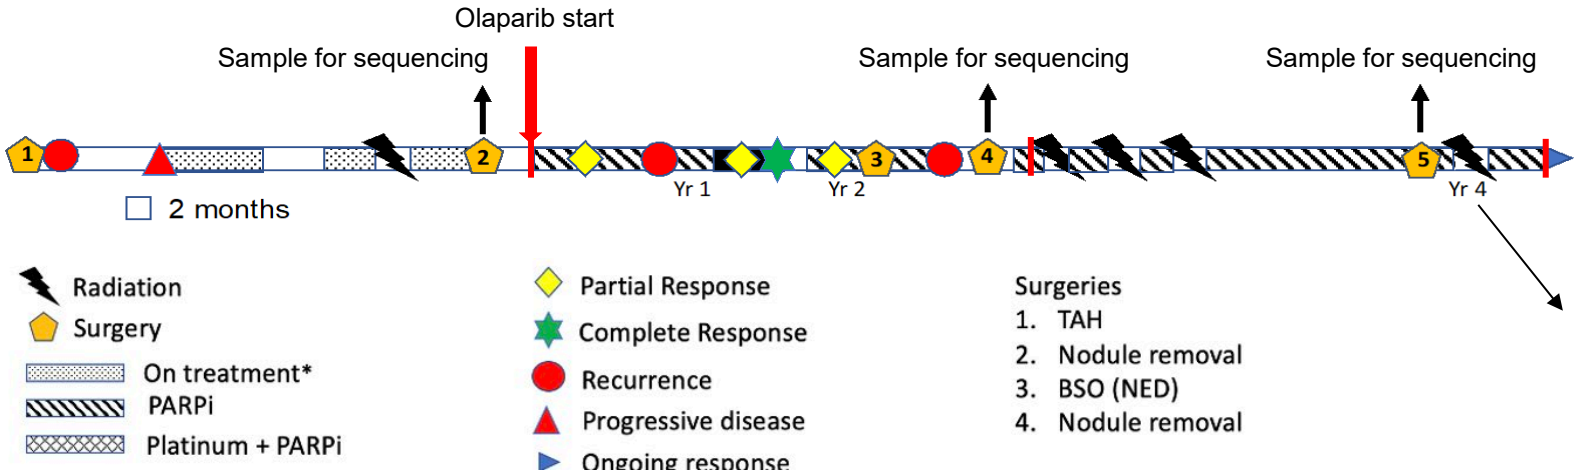






Cassandra Vandenberg, Kathy Barber, Silvia Stoev, Sean Grimmond, Joep Vissers, Layla Zhu, Wing-Yee Lo, Oliver Hofmann, Jocelyn Penington, Justin Bedo, Tony Papenfuss, Gayanie Ratnayake, Teng Tan, Ian Collins, Steve Barnett, Matt Wakefield

# Progression post cisplatin + olaparib: WGS sample #3 *PARG* rearrangement



Olaparib continued

4 brain mets, lung mets, new kidney met

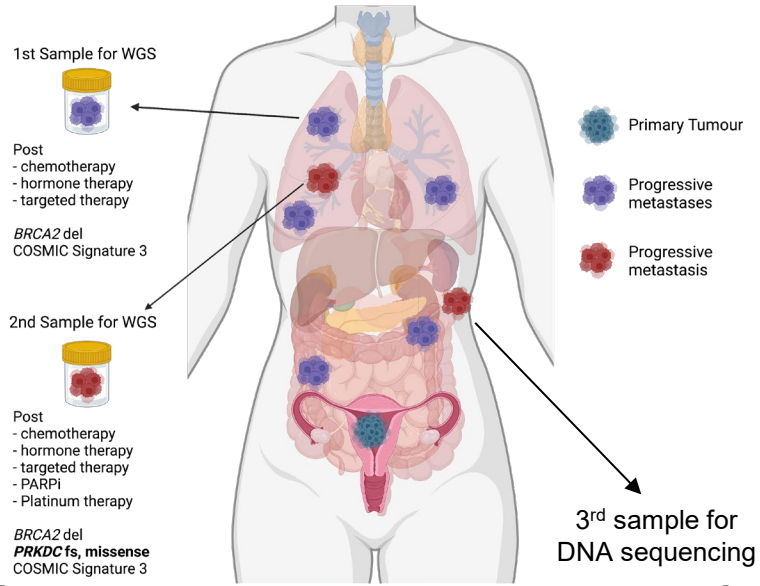
**ECOG 0-1**

**Radiotherapy (SABR) to kidney, brain**

**HAD BEEN ON OLAPARIB +/- cisplatin for > FOUR YEARS**

**Whole genome sequencing #3 performed:**

- Previous findings confirmed (*TP53, RB1, BRCA2*, Mutation Signature 3)
- New:
- *PRKDC* mutations (2x) NOT PRESENT
- *ATRX* rearrangement, c/w clonal heterogeneity
- ***PARG* rearrangements**



**Considering ATRi trial:**

**Gogola et al, Cancer Cell, 2018:**
Loss of PARG = resistance to PARPi in mouse mammary tumours – inc radiosensitivity

**da Costa et al, Nat Rev Can, 2023:**
Cells that become PARPi resistant through PARG down-regulation exhibit high replication stress and dependence on ATR-CHK1-WEE1 pathway

Cassandra Vandenberg, Kathy Barber, Silvia Stoev, Sean Grimmond, Joep Vissers, Layla Zhu, Wing-Yee Lo, Oliver Hofmann, Jocelyn Penington, Justin Bedo, Tony Papenfuss, Gayanie Ratnayake, Teng Tan, Ian Collins, Steve Barnett, Matt Wakefield

# uLMS Future Directions

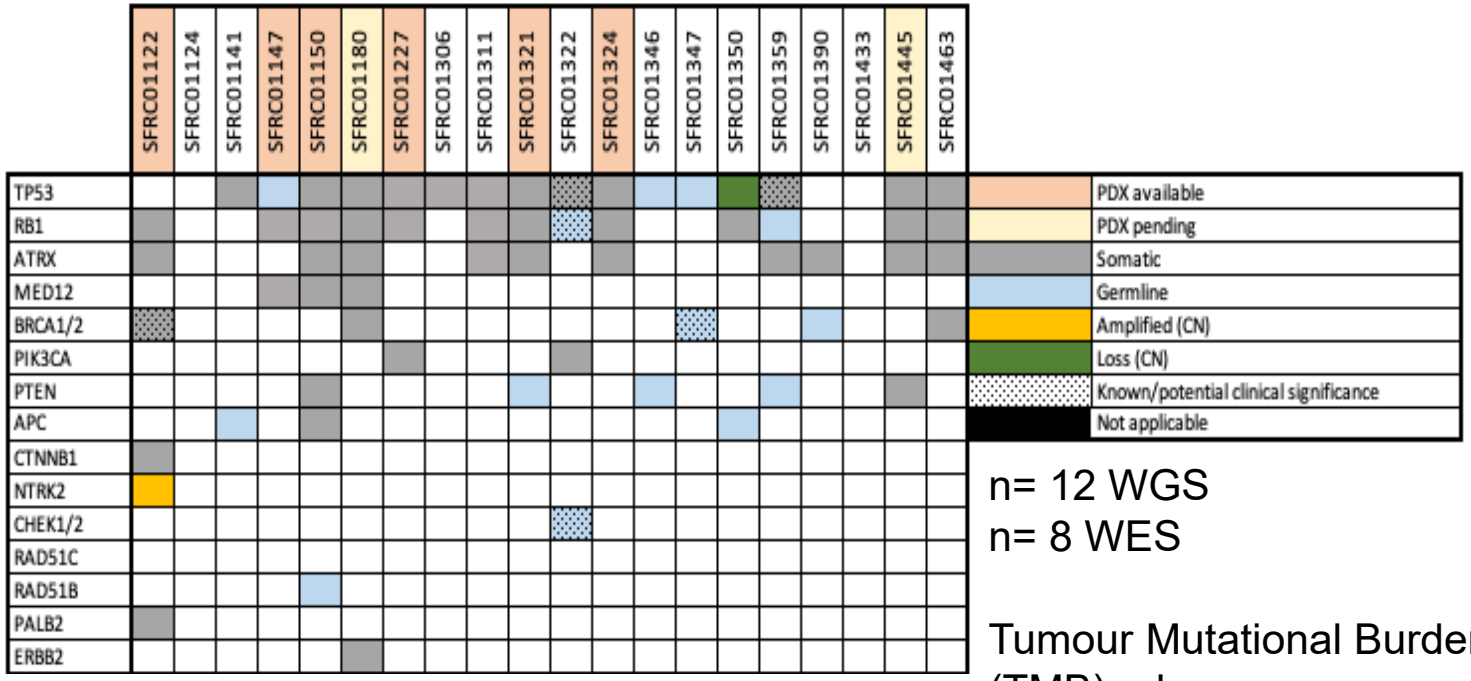
WEHI brighter together

**Dr Holly Barker**

- **HRD Screening of uLMS is required**
- **~10% of our uLMS cohort are HRD**
- **Clinical and pre-clinical evidence of PARPi benefit in HRD patients**
- **Demonstration of efficacy for PARPi combinations with platinum or RT**
- New interpretation of COSMIC signature 3
  – combine with HRDetect/CHORD and LoH scores
- 20 uLMS PDX models: explore uLMS biology - HRD and non-HRD
- Collaboration with Prof Roger Reddel and Dr Liz Connolly, Proteomics of uLMS

**ESMO 2024 1727MO - Can proteomics predict metastatic relapse in leiomyosarcoma (LMS)? Development of an 8 protein signature in a >350 sample study including a validation cohort**

## Most uLMS have nothing clinically actionable on WGS: need research urgently



n= 12 WGS
n= 8 WES

Tumour Mutational Burden (TMB) ~ low

# New targeted therapy combinations for USC

USC comprises 10% of endometrial cancer cases but is responsible for at least **40% of endometrial cancer-related deaths** (and is also increasing with rising obesity)

Overall survival rate is just 18-27%

Total number of cases in SFRCP: **69**

(46 with molecular data)

**Potentially HRD = 15/46 (32.6%)**

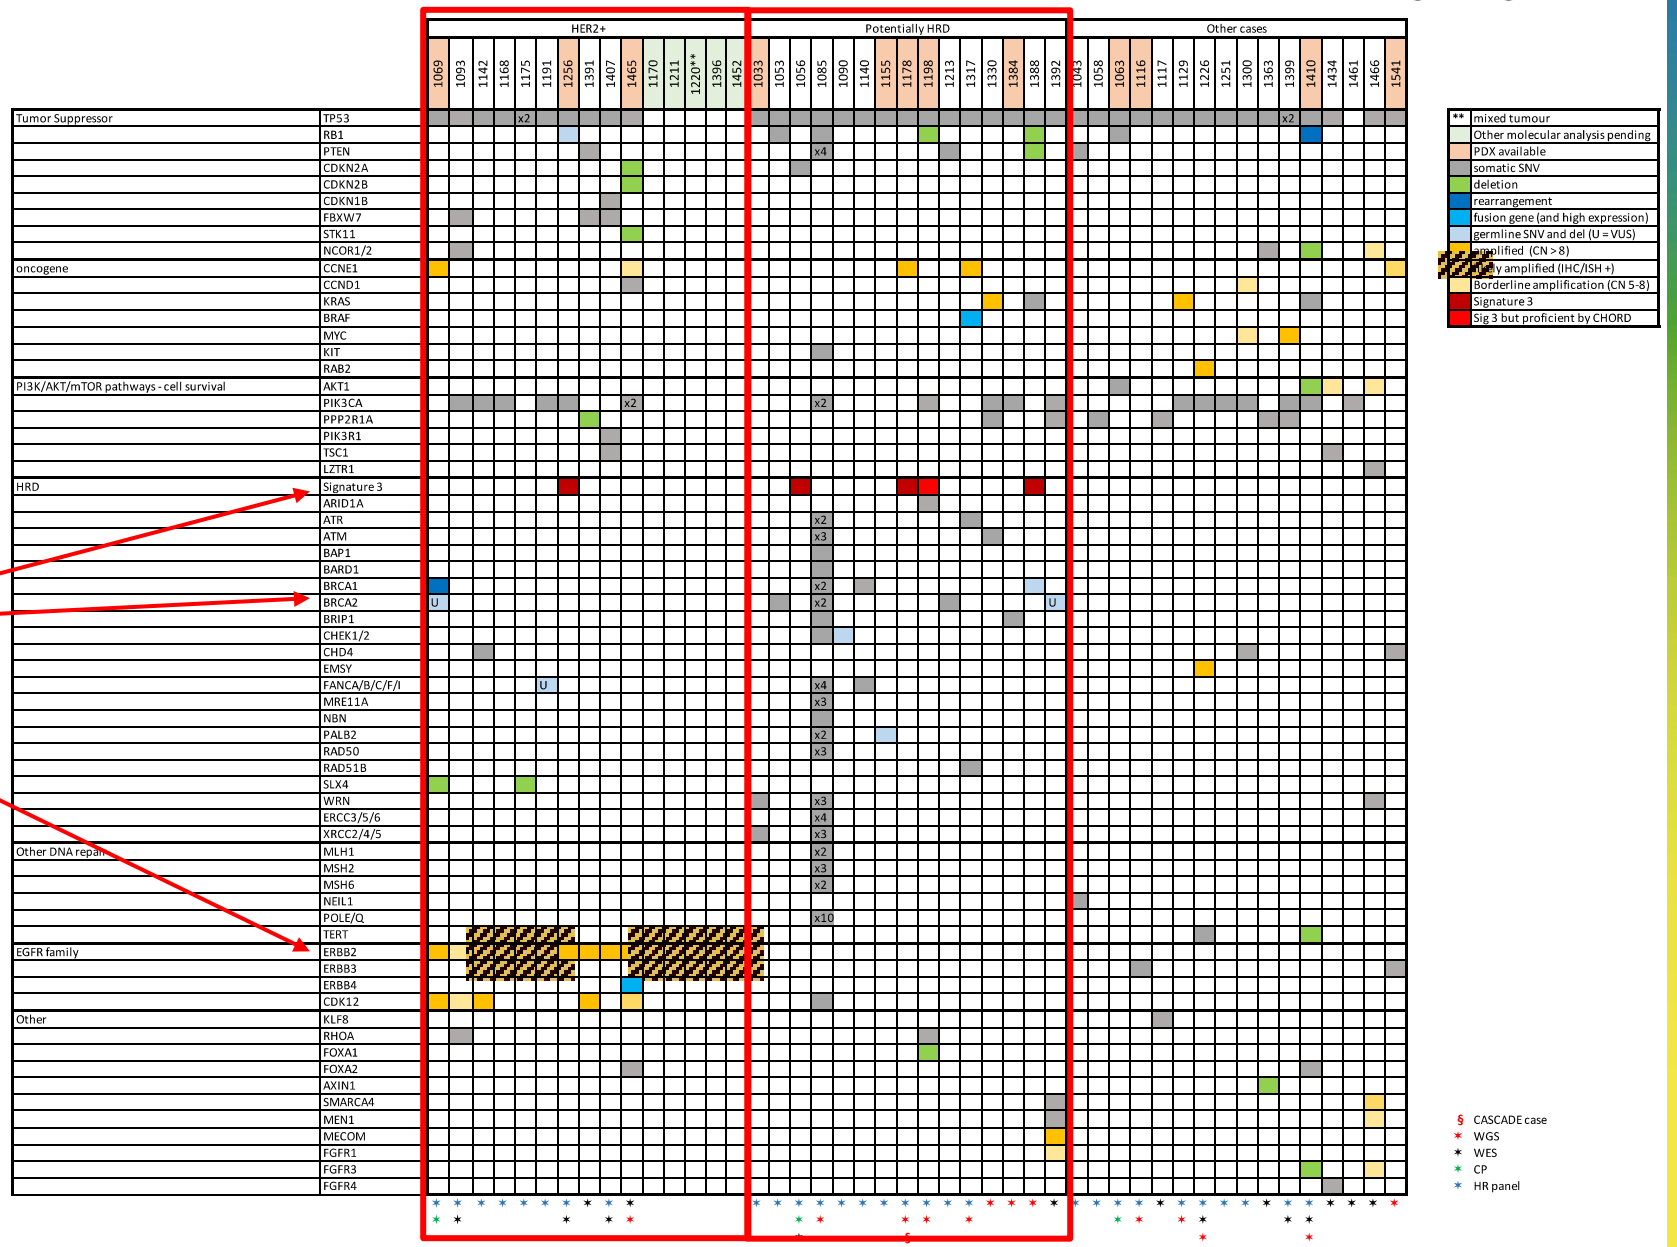
**HER2+ = 15/46 (32.6%)**

HRD;

Homologous Recombination Deficient = potentially sensitive to PARP inhibitors (PARPi)

<u>Aim:</u>

Develop cell lines and organoid models in which to test response to combinations involving PARPi and other therapies



# New targeted therapy combinations for USC

Dr Holly Barker

## Cell lines

#1256 – *ERBB2* amplification

#1116 – *ERBB3* mutation

#1178 – Sig 3 and *CCNE1* amplification

## Plan:

Initial drug screening for potential combinations involving:

- PARPi
- HER2i (i.e. T-Dxd)
- RT

| | | HER2+ | | | Potentially HRD | | | | Other cases | | | | |

# Therapeutic response and resistance informed by preclinical models of rare gynaecological cancers

- **Include rare gynaecological cancers in research planning**

- Molecular sequencing and other characterization is essential
- Preclinical models – PDX, PDX-derived organoids, PDX-derived cell lines, cell lines all have unique utility, depending on the context, add value
- The study of drug resistance must occur at the same time as studying drug response
- Value is cumulative and worthwhile: PDX provide very pure populations of tumour cells for analysis, allowing analyses which could not otherwise be performed
