LEARNING GOALS

Recognize and approach children and adults with low neutrophils to define the diagnosis

Adopt management strategies for neutropenia patients

Design appropriate follow-up according to the neutropenia type

NEUTROPENIA THRESHOLD

From 14 days to 1 year	**< 1.0 x 10^9/L**
Children > 1 year to adulthood	**< 1.5 x 10^9/L**
Adult	**<1.8 x 10^9/L**

Mild 1.0 - 1.5 (or 1.8 for adults) × 10^9/L
Moderate 0.5 -1.0×10^9/L
Severe <0.5 × 10^9/L

Agranulocytosis <0.2×10^9/L usually associated with a high risk of severe, life-threatening infections
Acute <3months
Chronic>3months

Fioredda F, Haemasphere 2023

NEUTROPENIA *definition & classification*

CHRONIC
benign
NEUTROPENIA
SEVERE
Congenital
IDIOPATHIC
acute
AUTOIMMUNE
PRIMARY
ISOLATED
SECONDARY

European Reference Network

CLASSIFICATION of chronic neutropenias

CONGENITAL

- Isolated
- Associated with various extrahematological manifestations
- Associated with immunodeficiency/immune dysregulation
- Associated with metabolic disorders and nutritional deficiency
- Associated with bone marrow failure

ACQUIRED

- Primary or Idiopathic
  - ✓Antibody-mediated
  - ✓Non-antibody mediated
- Secondary due to
  - ✓Hypersplenism
  - ✓Infections
  - ✓Autoimmune diseases
  - ✓Nutritional deficiencies
  - ✓Hematologic diseases
  - ✓Drug-induced

LIKELY ACQUIRED

In children/adolescents, young adults

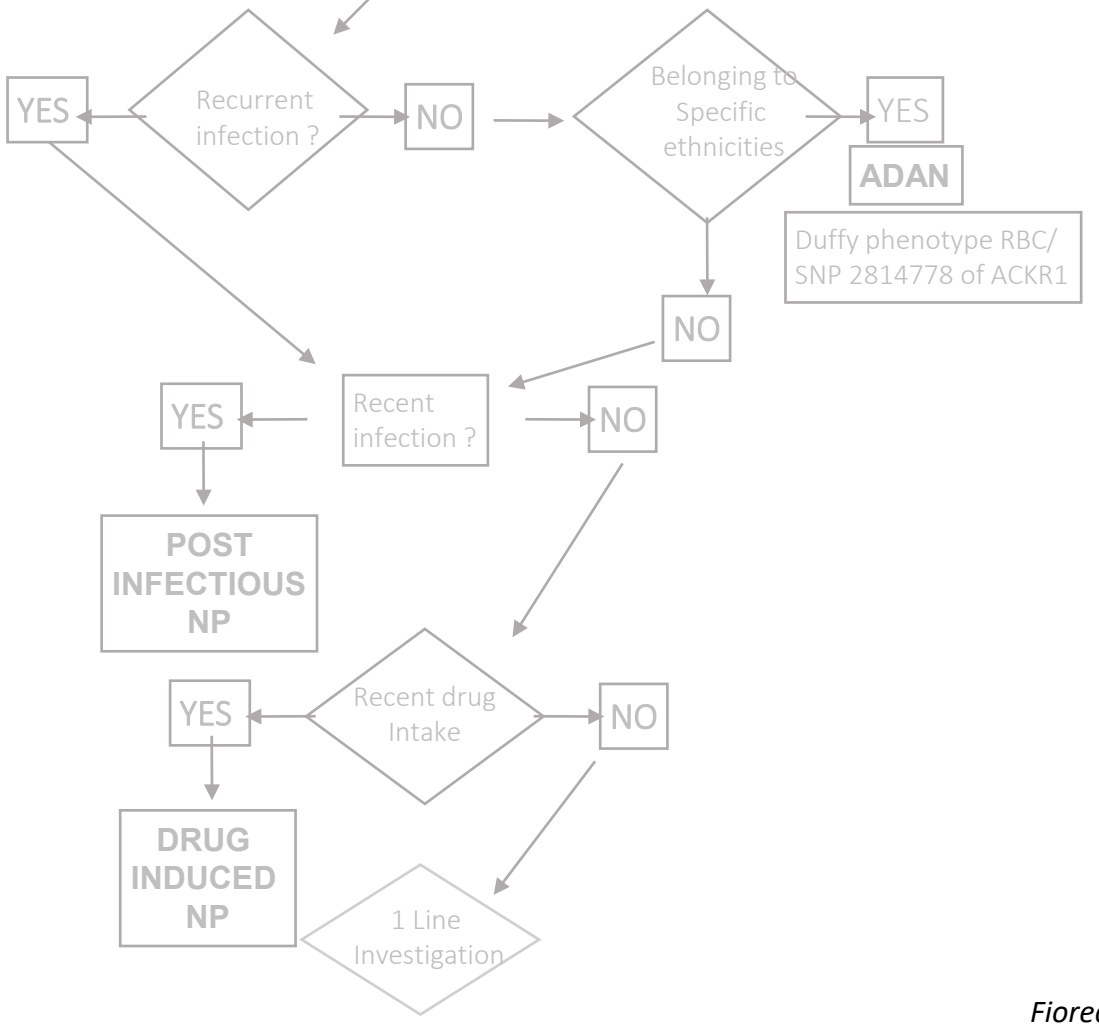
Late-onset/Long lasting

Fioredda F Haemasphere 2023

European Reference Network

DIAGNOSTIC ALGORYTHM 1

Isolated chronic neutropenia with/without extra-hematological **symptoms/signs suggestive of an underlying congenital neutropenia syndrome**



European Reference Network

Fioredda F, Haemasphere 2023

Symptoms/signs suggestive of an underlying congenital neutropenia syndrome

FAMILY HISTORY

Consanguineity
Malformations
Neutropenic relatives & unexplained infant death or miscarriages
Infections type and time

CLINICAL EXAMINATION

Failure to thrive
Cognitive impairment
Developmental delay
Dysmorphism (mainly skeletal)
Nail, hair or skin abnormalities (i.e. superficial veins)
Signs of bronchiectasis
Organ enlargment or malformation (liver , spleen , heart, genitourinaryjoint symptoms)
and finally signs of photophobia, nystagmus, oculocutaneous albinism, and neuropathy.

European Reference Network

Symptoms/signs suggestive of an underlying congenital neutropenia syndrome

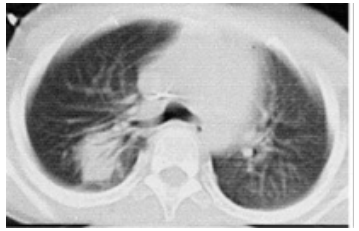
PERSONAL & FAMILY HISTORY

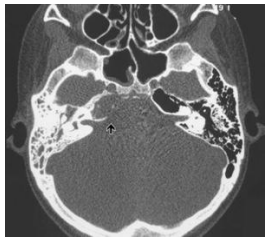
Consanguinity

Malformations

Neutropenic relatives & unexplained infant death or miscarriages

Infections type and time





>>Staphylococcus aureus, Pseudomonas aeruginosa, Escherichia coli, Streptococcus pyogenes

<< Candida spp & Aspergillus spp

European Reference Network

NP DIAGNOSIS in children

Significative elements to produce a score

key informations needed to make a diagnosis of congenital neutropenia

Family history/**consanguinity**
Any associated morbidity
Severe infections (Cellulitis; pneumonitis; any sepsis; any deep bacterial infections)
Stomatitis or gingivitis
Monocytes >1.5 × 10^9/l
Hemoglobin <90 g/l or platelets <150 × 10^9/l

Bejjani N, Ped Blood and Cancer 2017

European Reference Network

DIAGNOSTIC FAST TRACK

Severe neutropenia (either isolated or associated to any signs of complex syndromes)

Severe infections (sepsis, meningitis, osteomyelitis,deep abscesses/flemmons or pneumonia) or recurrent/torpid infections (i.e. otitis, masthoiditis, skin abscesses, urinary tract infections, enteritis)

Early infancy

First level investigations & bone marrow examination

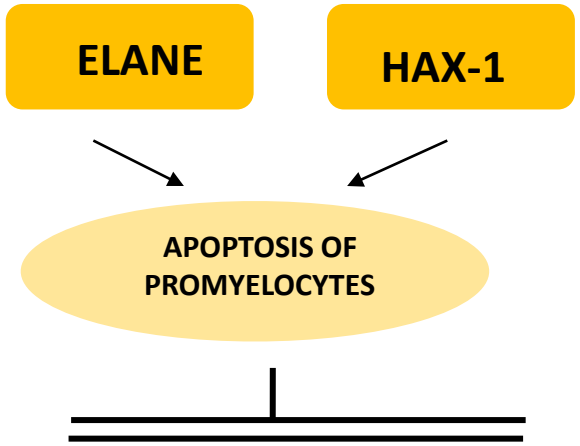
Targeted genes analysis

Sanger tecnique

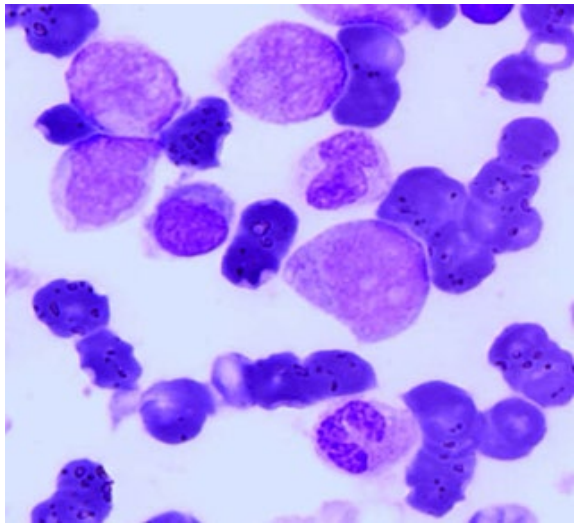
ELANE, HAX1

European Reference Network

PATHOGENETIC MECHANISMS



Block in the bone marrow



LEF1 e CEBP αlfa
HYPOESPRESSION
Block at Promyelocytes

PU1 Hyperespression
Monocytes proliferation

JAK2 e STAT5 activation
Prolypherative stimulus

Skokowa J Hematol Oncol Clin N Am 2013

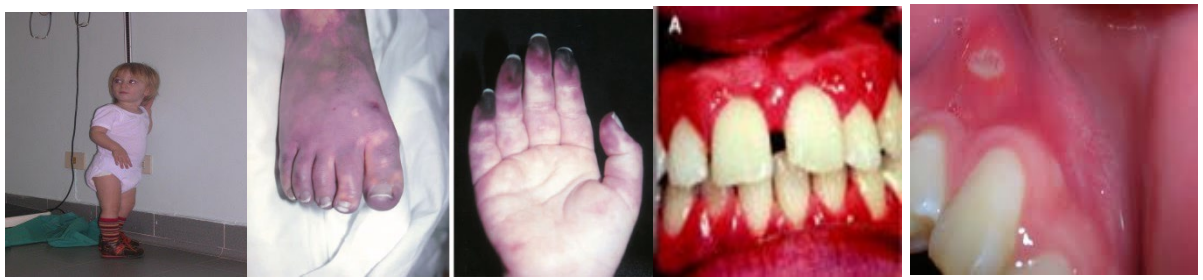
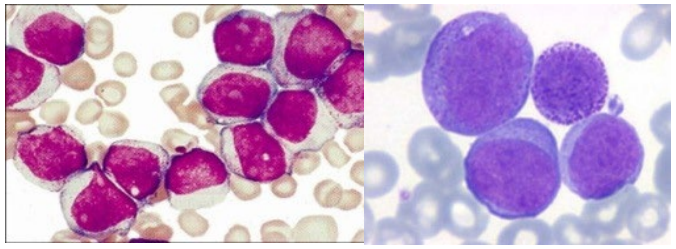
SCN NATURAL HISTORY

- ✓ Recurrent infections
- ✓ Not always easy eradication



Infections even lethal

Trasformation to MDS/ AL



SCN treatment

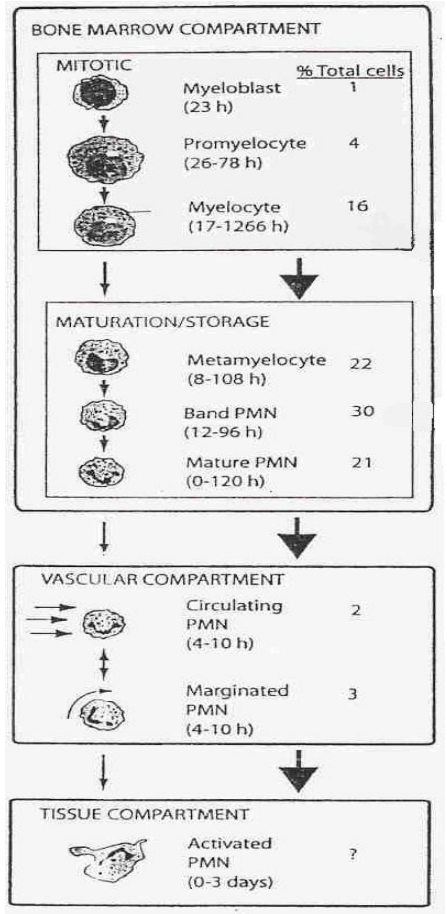
G-CSF

Tailored therapy: minimal dose for the best effect
standard 5 gamma/kg/die)

Goal: absolute neutrophil count (ANC)
1.0 - 5.0 $X10^9$/L

G-CSF responders 90% of pts

Responders till 15 µg/Kg/d
Scarse responders 15-20 µg/Kg/d
No responders > 20 µg/Kg/d



Donadieu J, Haematologica 2005, Welte K Sem Hematol 2006, Fioredda F , Am J Hematol 201

INDICATION TO HSCT

Strong Indication to HSCT

MDS/AML or BM dysplastic features (monosomy 7, trisomy 8, trisomy 21)

CN due to mutations carrying an intrinsic high risk of leukemic transformation per se

No response to G-CSF (doses >20mcg/kg/day), poor response to G-CSF(10 -20 mcg/kg/day)

or poor control of infection irrespective of the G-CSF dose

Potential indication to HSCT Adequate management of infections with G-CSF at “intermediate doses” (10 mcg-15 mcg /kg/day) with availability of a healthy HLA-identical sibling or HLA identical matched donor

Weak indication to HSCT G-CSF response at doses up to 10 mcg/kg/day, good tolerability and compliance to daily subcutaneous injections, infections control and unavailability of HLA-matched donors

Fioredda F, in preparation

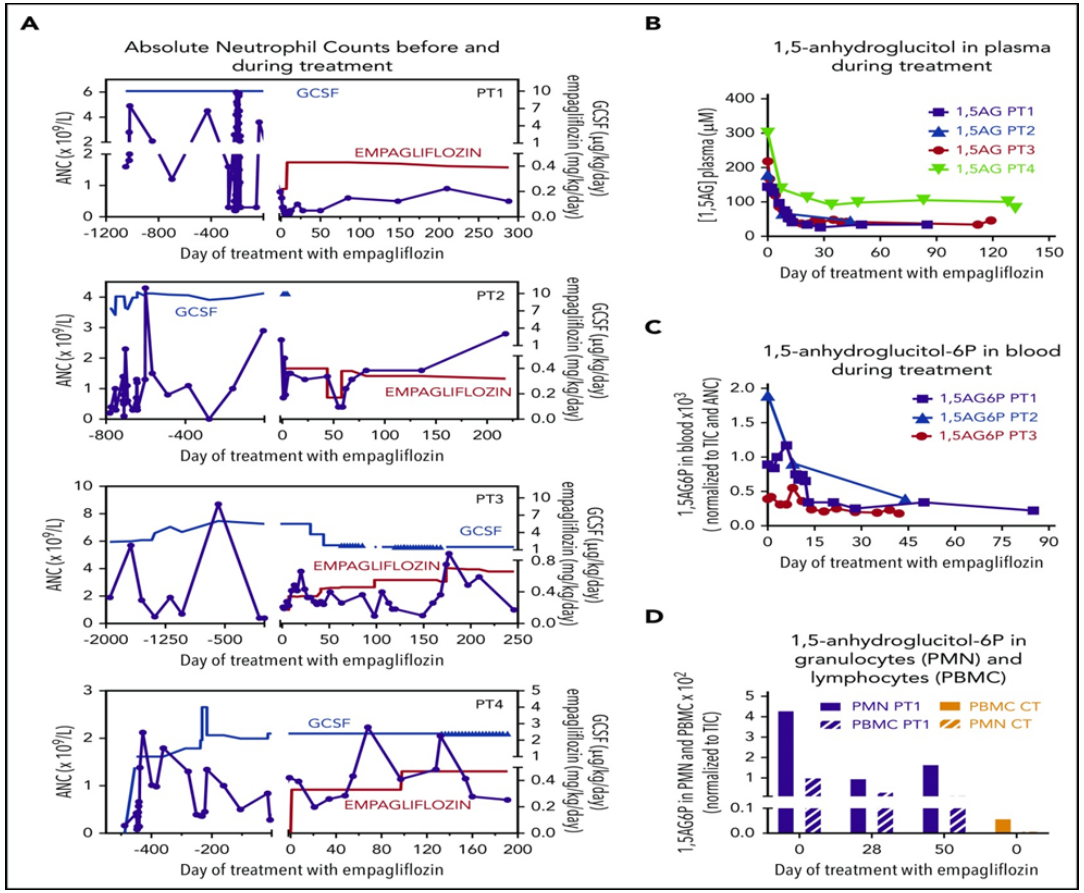
EMPAGLIFOZIN

G6PC3 and G6PT/SLC37A4 deficiency

Missing defosforilation of 1,5-anydroglucitol-6-posphate (1,5 –AG6P)

Accumulation inside neutrophil → inihibition of glucose utilization by the neutrophil-> disfunction



Empaglifozin counter acts the renal riabsoption of 1,5-AG6P

Wortmann SB Blood 2000, Boulanger C J Inherit Metab Dis 2022

European Reference Network

Empagliflozin or dapaglifozin

French Registry

0.2mg/kg/day or 0.4mg/kg/day

21 patients (GSD1b 14 , G6PC3 7)
Median fUP 0.8 yrs
Median age at start th 18.8 yrs(0.4 37.7)

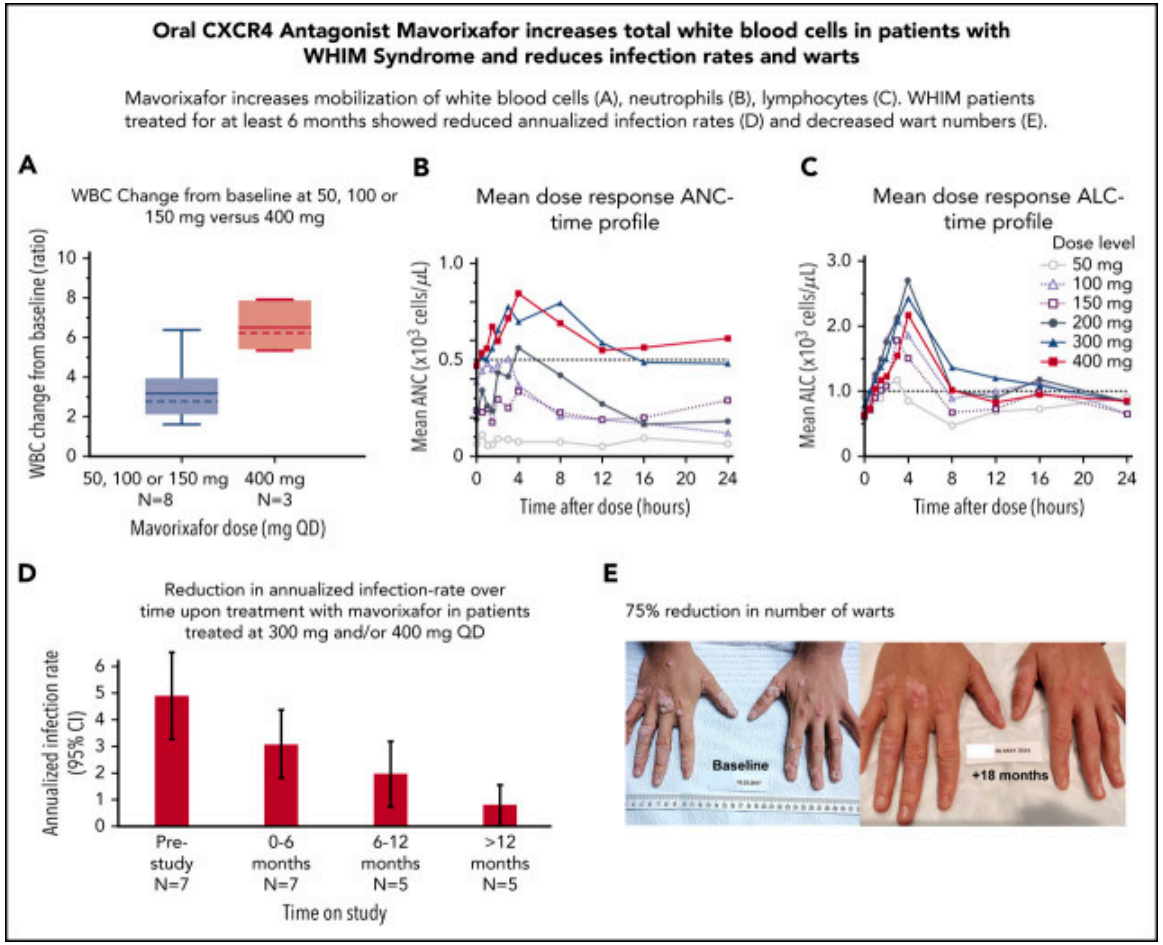
- Lower value of 1,5-AG in plasma
- Increase value of neutrophils
- Reduced dose of G-CSF (from 2,5 ug7kg/d to 0.31 ug/kg/d)
- Reduced IBD
- Less damage ro ER in the neutrophild (electronic image)
- Side effects Neutrophilia in G6PC3, transient vomit

AbASH2022

European Reference Network

MAVORIXAFLOR in CXCR4 NP

Mavorixafor is an oral small molecule selective antagonist of the CXCR4 receptor that increases mobilization and trafficking of white blood cells from the bone marrow.



Dale DC , Blood 2020

European Reference Network

SEVERE CONGENITAL NEUTROPENIA

rationale for follow up

To monitor neutropenia associated clinical manifestation (gingivitis, periodontitis) and G-CSF chronic side effects (splenomegaly, osteoporosis etc)

To adjust G-CSF doses according to individual infective burden

To monitor the risk of MDS/AML risk transformation

Fioredda F, Haemasphere 2023

European Reference Network

NEED FOR FOLLOW UP AND FREQUENCIES

Annual BM or more often if count drops

- morphology
- cytogenetics
- NGS for somatic mutations in malignant myeloid genes to intercept CLONAL EMOPOIESIS and early MDS/Leukemia

(CSF3-R, RUNX1,TP53 biallelic mutations in SDS)

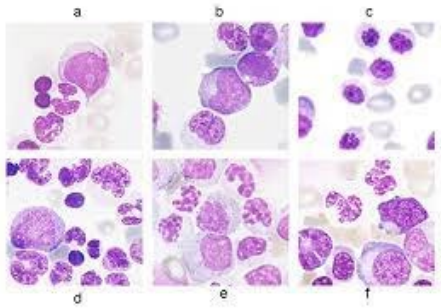
CSF3-R mutations may stay as such for years w/out development of leukemia

European Reference Network

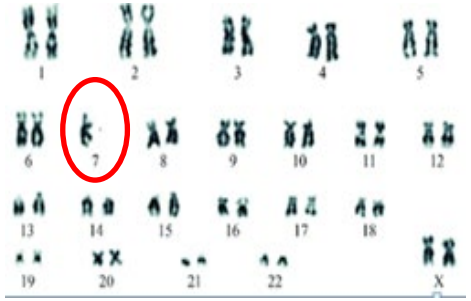
Fioredda F, Haemasphere 2023

Predictors of transformation to MDS/AML

- Marrow dysplastic changes



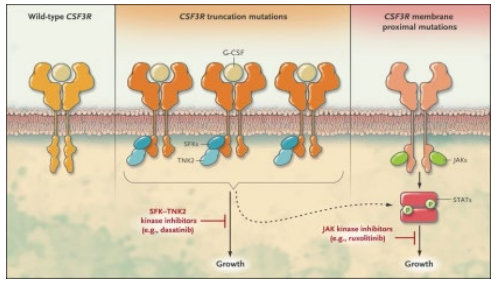
- Cytogenetic abnormalities: trisomy 21, monosomy 7, del q7

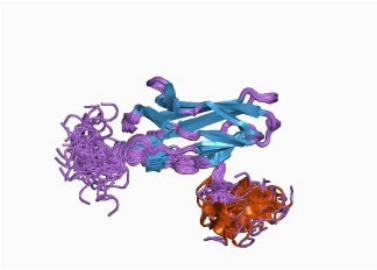


- Somatic leukemia-associated mutations

  CSF3R, RUNX1, ASXL1.

  Also PTPN11, TP53,SETBP1 in combination with CSF3R





- In SDS biallelic TP53 mutations

First-line investigations

CBCs, PB smear, biochemistry tests including liver and kidney function, immunoglobulin levels, CRP, vitamin B12 and folate, flow cytometric analysis of PB lymphocyte subsets, virology antibody screening (i.e., HepB, HepC, HIV, EBV, CMV, and Parvovirus), **indirect antineutrophil antibodies (GIFT, GAT, and other);** thyroid hormones (FT3, FT4, TSH), antithyroid antibodies (anti-TG and anti-TPO).

Additional investigation in children: flow cytometric analysis of TCR-α/β-positive double-negative (CD4- and CD8-) CD3 PB lymphocytes.

Additional investigations in adults: antiphospholipid and anticardiolipin antibodies, flow cytometric analysis of LGL/TCR clonality in PB lymphocytes, serum ferritin, RF, ANA, ENA, ds-DNA, and ESR

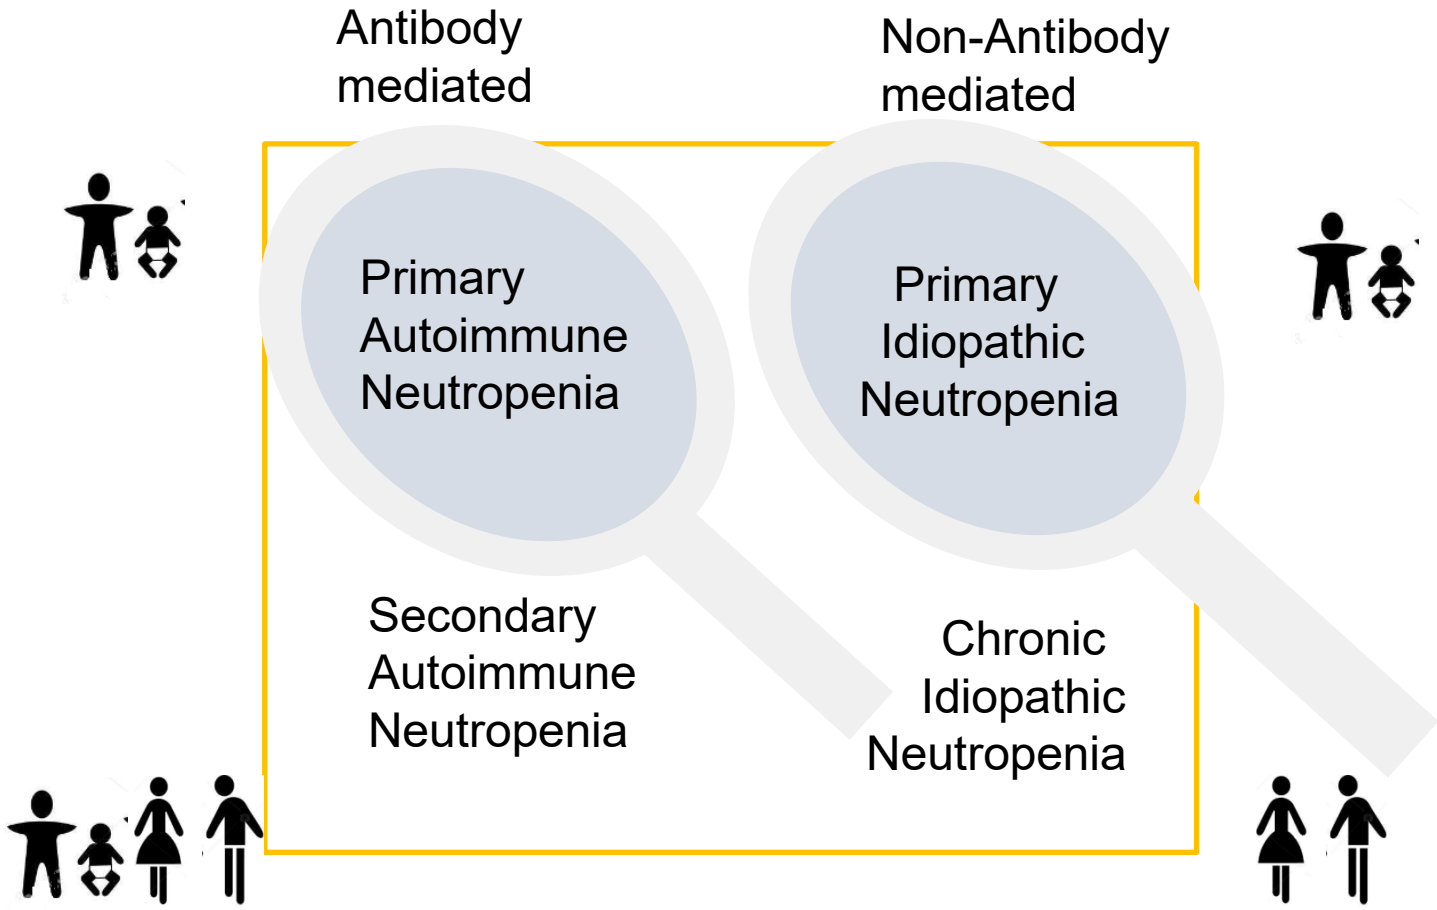
Late-onset/Long lasting

Fioredda *F, Haemasphere 2023*

European Reference Network

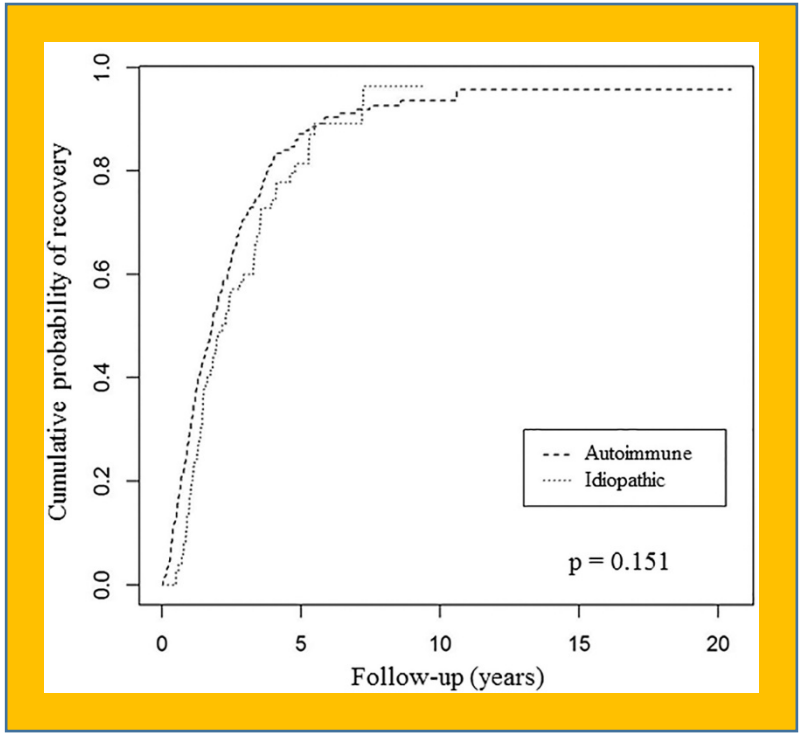
ACQUIRED NEUTROPENIA 1



European Reference Network

PRIMARY AUTOIMMUNE/IDIOPATHIC NEUTROPENIA of infancy

- Early infancy
- Usually detection by chance
- Rather low rate of severe infections (10%)
- Self limiting course within 24 -36 mo



Presence/absence of AbantiN !!

European Reference Network

Farruggia P, Am J Hematol 2015, Farruggia P et al Am J Hematol 2019

Management of primary AIN/IN

Counselling and contact

- Avoid overtreatment (blood count 3-4 times/y, repeat
- Repeat Ab against neutrophils if negative
- No need for basal bone marrow examination

- In case of recurrent of deep/severe infections G-CSF
- G-CSF schedule: preferably on demand use of the least dose for the best effect (1-3 ug/kg)

Fioredda F , Ped Blood and Cancer 2022

European Reference Network

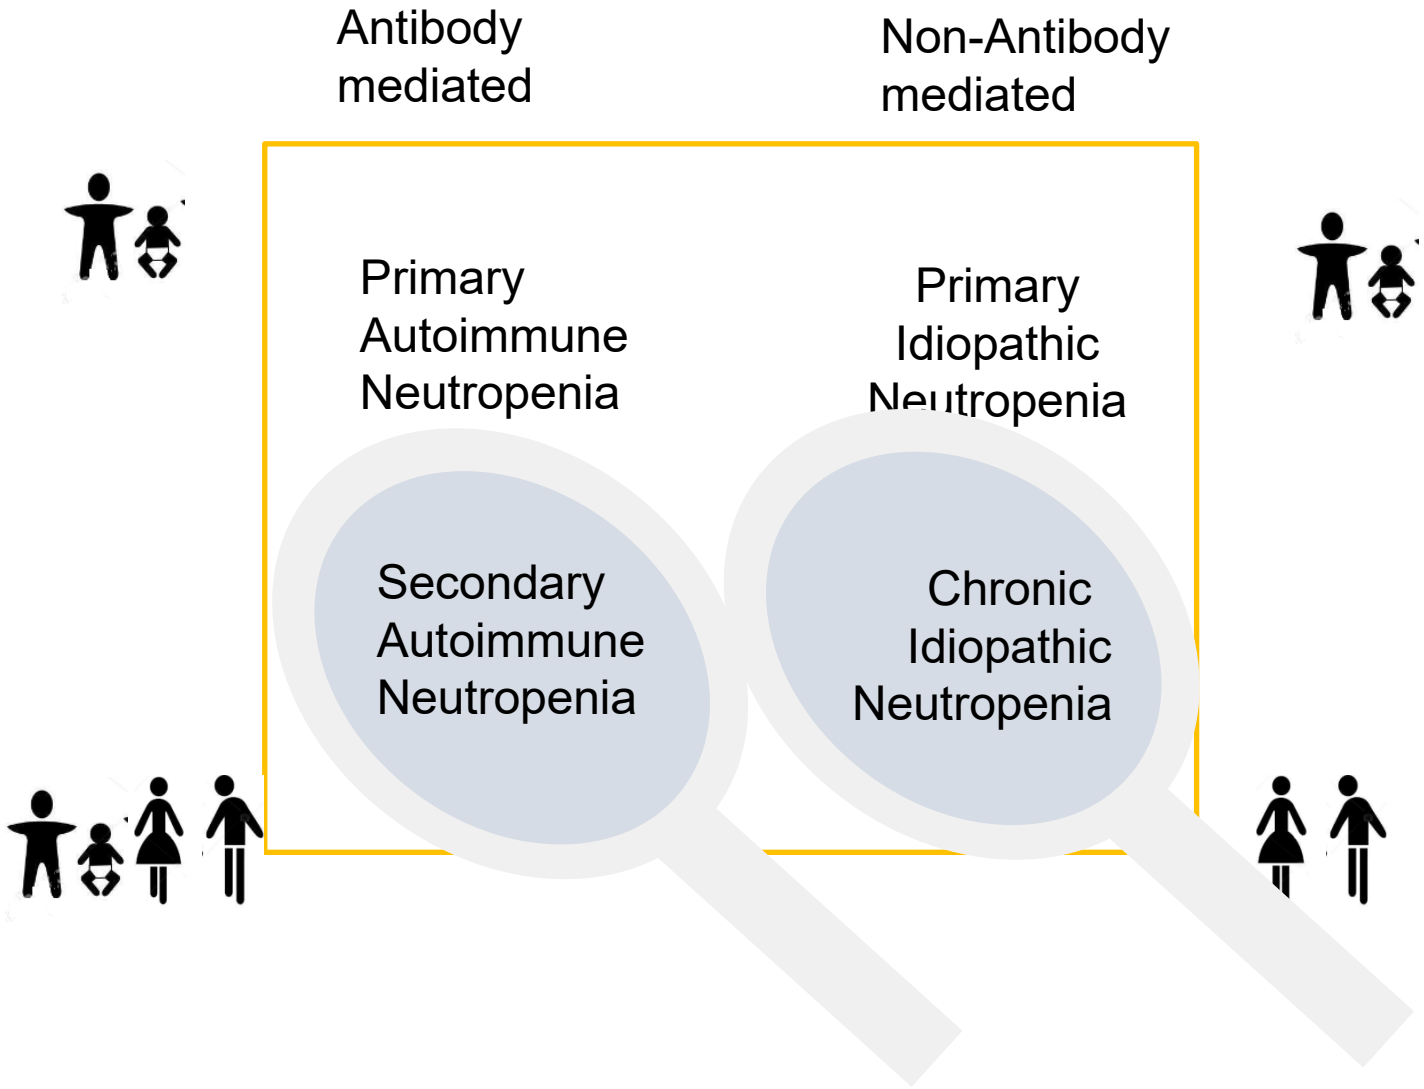
Why FUP?

- Family reassurance (time of resolution not always short…)
- Verify the remission of pAIN/pIN

SUDDEN resolution 70 % of cases TRANSIENT/ INTERMITTENT oscillation in 30% of cases

Farruggia et al, Am J Hematol 2015

ACQUIRED NEUTROPENIA 2

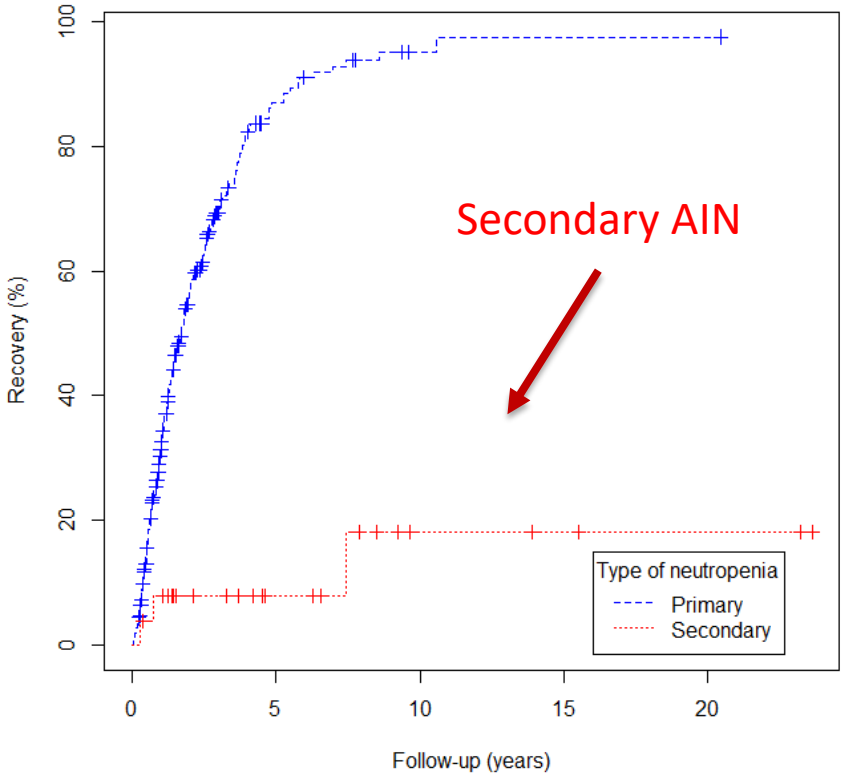


European Reference Network

SECONDARY AUTOIMMUNE NEUTROPENIA

Children

Recovery: primary vs secondary AIN of infancy



Adults

- Evans
- Autoimmune Thyroiditis
- SLE
- Sjogren syndrome
- Rheumatoid arthritis
- Felty's syndrome
- Crohn disease
- Autoimmune hepatitis
- Multiple sclerosis
- Drug
- Neoplasm/BMT

Farruggia et al, Am J Hematol 2017

European Reference Network

CHRONIC IDIOPATHIC NEUTROPENIA

ADULTS

Mild clinical phenotype/ mild NP

Pro-apoptotic mediators in the bone marrow

Leuco/lymphopenia

Occasionaly altered immunoglobulin levels
(<IgG,<IgA and > IgM)

> naïve B IgD^{+} $CD27^{-}$ cells

< class-switched memory B IgD^{-} $CD27^{+}$ cells

AntiN Ab negative

European Reference Network

Maouvrodi I Cli Immunol 2017, Tsaknakis G, Blood 2021

Management of CIN/sAIN

In case of recurrent of deep/severe infections G-CSF (the least dose for the best protection against infections)

Which type of FUP?

Blood Cell Count (morphological evaluation) every 3-4 months

BONE MARROW in patients with decreasing ANC or additional changes in other blood cell count (i.e.macrocytosis or morphological abnormalities) or in patients treated continuously with G-CSF

NGS panel/ Flow cytometry to exclude somatic variants

Somatic clones with VAF>10% closer follow-up (>4 times/year)

Consider Genetic investigations for constitutional variants

Fioredda F, Haemasphere 2023
